SN65DSI84 MIPI® DSI Bridge To FLATLINK™ LVDS Single Channel DSI to Dual-Link LVDS Bridge

1 Features

- Implements MIPI® D-PHY version 1.00.00 physical layer front-end and display serial interface (DSI) version 1.02.00
- Single channel DSI receiver configurable for one, two, three, or four D-PHY data lanes per channel operating up to 1 Gbps per lane
- Supports 18 bpp and 24-bpp DSI video packets with RGB666 and RGB888 formats
- Suitable for 60-fps WUXGA 1920 × 1200 resolution at 18-bpp and 24-bpp color, 60 fps 1366 × 768 at 18 bpp and 24 bpp
- FlatLink™ output configurable for single-link or dual-link LVDS
- Supports single channel DSI to dual-link LVDS operating mode
- LVDS output clock range of 25 MHz to 154 MHz in dual-link or single-link modes
- LVDS pixel clock may be sourced from free-running continuous D-PHY clock or external reference clock (REFCLK)
- 1.8-V main V_{CC} power supply
- Low power features include shutdown mode, reduced LVDS output voltage swing, common mode, and MIPI ultra-low power state (ULPS) support
- LVDS channel swap, LVDS PIN order reverse feature for ease of PCB routing
- ESD rating ±2 kV (HBM)
- Packaged in 64-pin 5-mm × 5-mm nFBGA (ZXH)
- Temperature range: –40°C to 85°C

2 Applications

- PC & notebooks
- Tablets
- Connected peripherals & printers

3 Description

The SN65DSI84 DSI to FlatLink™ bridge features a single-channel MIPI® D-PHY receiver front-end configuration with 4 lanes per channel operating at 1 Gbps per lane; a maximum input bandwidth of 4 Gbps. The bridge decodes MIPI® DSI 18bpp RGB666 and 24 bpp RGB888 packets and converts the formatted video data stream to a FlatLink™ compatible LVDS output operating at pixel clocks operating from 25 MHz to 154 MHz, offering a Dual-Link LVDS, Single-Link LVDS interface with four data lanes per link.

The SN65DSI84 is well suited for WUXGA 1920 x 1200 at 60 frames per second, with up to 24 bits-per-pixel. Partial line buffering is implemented to accommodate the data stream mismatch between the DSI and LVDS interfaces.

Designed with industry compliant interface technology, the SN65DSI84 is compatible with a wide range of micro-processors, and is designed with a range of power management features including low-swing LVDS outputs, and the MIPI® defined ultra-low power state (ULPS) support.

The SN65DSI84 is implemented in a small outline 5x5mm nFBGA at 0.5 mm pitch package, and operates across a temperature range from -40°C to 85°C.

Device Information (1)

PART NUMBER	PACKAGE	BODY SIZE (NOM)
SN65DSI84	nFBGA (64)	5.00 mm × 5.00 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision G (June 2018) to Revision H (October 2020) **Page**

- NOTE: The device in the MicroStar Jr. BGA packaging were redesigned using a laminate nFBGA package. This nFBGA package offers datasheet-equivalent electrical performance. It is also footprint equivalent to the MicroStar Jr. BGA. The new package designator in place of the discontinued package designator will be updated throughout the datasheet....1
- Changed u*jr ZQE to nFBGA ZXH....1
- Changed u*jr ZQE to nFBGA ZXH....4
- Changed u*jr ZQE to nFBGA ZXH. Updated thermal information....6
- Changed u*jr ZQE to nFBGA ZXH....41

Changes from Revision F (August 2015) to Revision G (June 2018) **Page**

- Deleted figure *Shutdown and Reset Timing Definition While V_{CC} Is High*....9
- Changed the paragraph following Figure 7-3....14
- Changed *Recommended Initialization Sequence* To: *Initialization Sequence*....14
- Changed Table 7-2....14
- Changed item 3 in *Video Stop and Restart Sequence* From: Drive all DSI input lanes including DSI CLK lane to LP11. To: Drive all DSI data lanes to LP11, but keep the DSI CLK lanes in HS....33

Changes from Revision E (October 2013) to Revision F (August 2015) **Page**

- Added *Pin Configuration and Functions* section, *ESD Ratings* table, *Feature Description* section, *Device Functional Modes*, *Application and Implementation* section, *Power Supply Recommendations* section, *Layout* section, *Device and Documentation Support* section, and *Mechanical, Packaging, and Orderable Information* section....1
- Changed ULPS Itemized List, item 3 from "Wait for the PLL_LOCK bit (CSR 0x0A.7) to be set" to "Wait for a minimum of 3 ms."....13
- Changed Initialization Sequence Description for Init seq7 from "Wait for the PLL_LOCK bit to be set (CSR 0x0A.7)" to "Wait for a minimum of 3 ms."....14
- Changed Table 7-6 Address 0x0A, Bit 7 description from "PLL_LOCK" to "PLL_EN_STAT"....23
- Changed Address 0x18, Bits 3, 2, 1, and 0 Descriptions in Table 7-8 for clarification....23

- Changed Item 1 of the Video STOP and Restart sequence from "Clear the PLL_EN bit to 0(CSR 0x0A.7)" to "Clear the PLL_EN bit to 0 (CSR 0x0D.0)" 33

Changes from Revision D (August 2013) to Revision E (October 2013) **Page**

- Added rows for Bits 7, and 6:5 to Table 7-7 CSR Bit Field Definition – DSI Registers..... 23

Changes from Revision C (December 2012) to Revision D (August 2013) **Page**

- Aligned package description throughout datasheet..... 1

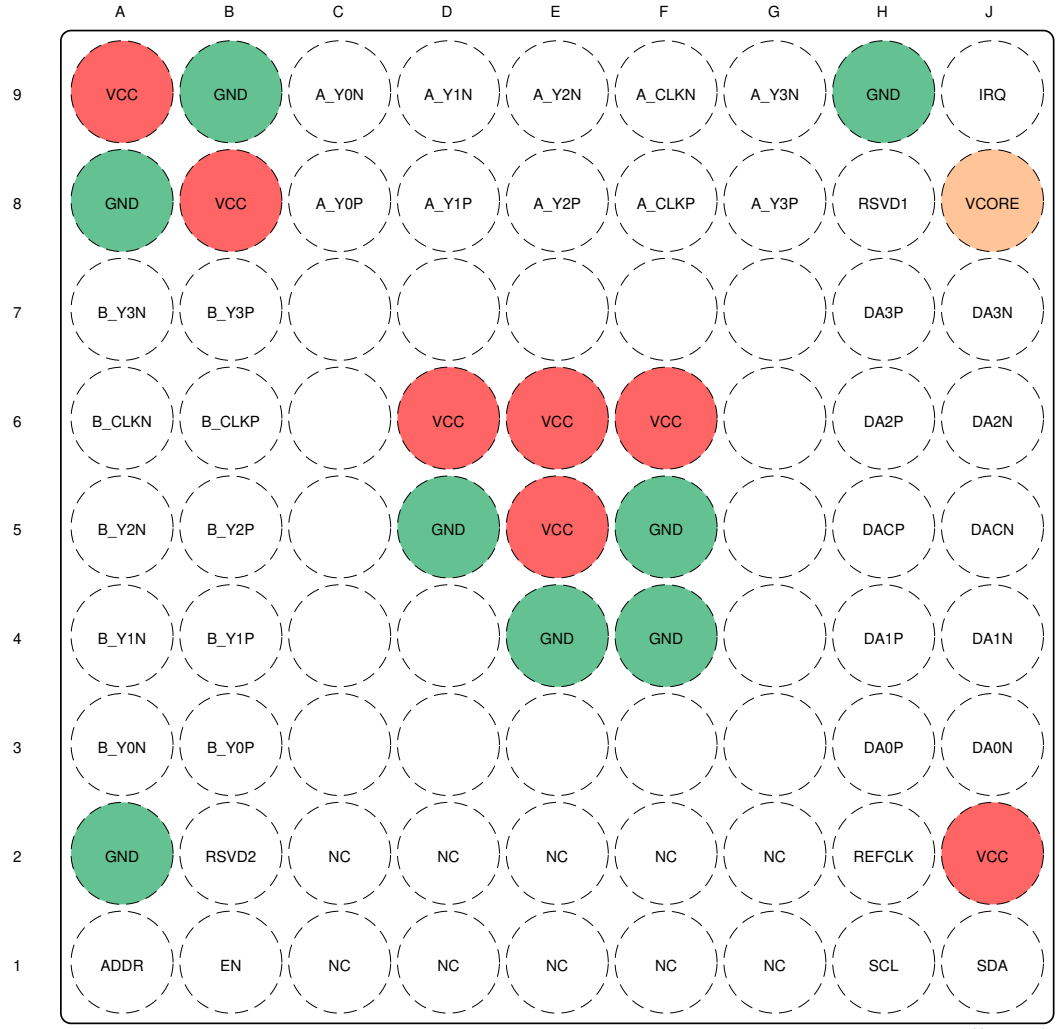
Changes from Revision A (December 2012) to Revision B (December 2012) **Page**

- Changed PGBA to PBGA..... 1

Changes from Revision * (August 2012) to Revision A (December 2012) **Page**

- Changed the value of V_{OH} From: 1.3 MIN To: 1.25 MIN..... 7
- Changed the I_{CC} TYP value From: 125 To: 106 and MAX value From: 200 To: 150 7
- Added a TYP value of 7.7 to I_{ULPS} 7
- Changed the I_{RST} TYP value From: 0.05 To: 0.04 and MAX value From: 0.2 To: 0.06..... 7
- changed the values of |VOD|..... 7
- Changed the values of $V_{OC(SS)}$ for test conditions CSR 0x19.6 = 0 and, or CSR 0x19.4 = 0..... 7
- Changed table note 2..... 7
- Added table note 3..... 7
- Changed the SWITCHING CHARACTERISTICS table..... 9
- Changed the description of CHA_LVDS_VOD_SWING..... 23
- Changed the description of CHB_LVDS_VOD_SWING..... 23

5 Pin Configuration and Functions



Not to scale

To minimize the power supply noise floor, provide good decoupling near the SN65DSI84 power pins. The use of four ceramic capacitors (2x 0.1 µF and 2x 0.01 µF) provides good performance. At the least, it is recommended to install one 0.1 µF and one 0.01 µF capacitor near the SN65DSI84. To avoid large current loops and trace inductance, the trace length between decoupling capacitor and device power inputs pins must be minimized. Placing the capacitor underneath the SN65DSI84 on the bottom of the PCB is often a good choice.

Table 5-1. Pin Functions

PIN			DESCRIPTION
NAME	NO.	I/O	
DA0P	H3	LVDS Input (HS) CMOS Input (LS) (Failsafe)	MIPI® D-PHY Channel A Data Lane 0; data rate up to 1 Gbps.
DA0N	J3		
DA1P	H4		MIPI® D-PHY Channel A Data Lane 1; data rate up to 1 Gbps.
DA1N	J4		
DA2P	H6		MIPI® D-PHY Channel A Data Lane 2; data rate up to 1 Gbps.
DA2N	J6		
DA3P	H7		MIPI® D-PHY Channel A Data Lane 3; data rate up to 1 Gbps.
DA3N	J7		
DACP	H5		MIPI® D-PHY Channel A Clock Lane; operates up to 500 MHz.
DACN	J5		

Table 5-1. Pin Functions (continued)

PIN			DESCRIPTION
NAME	NO.	I/O	
NC	C2, C1, D2, D1, F2, F1, G2, G1, E2, E1	No connects.	These pins should not be connected to any signal, power or ground.
A_Y0P	C8	LVDS Output	FlatLink™ Channel A LVDS Data Output 0.
A_Y0N	C9		
A_Y1P	D8		FlatLink™ Channel A LVDS Data Output 1.
A_Y1N	D9		
A_Y2P	E8		FlatLink™ Channel A LVDS Data Output 2.
A_Y2N	E9		
A_Y3P	G8		FlatLink™ Channel A LVDS Data Output 3. A_Y3P and A_Y3N shall be left NC for 18 bpp panels.
A_Y3N	G9		
A_CLKP	F8		FlatLink™ Channel A LVDS Clock
A_CLKN	F9		
B_Y0P	B3		FlatLink™ Channel B LVDS Data Output 0.
B_Y0N	A3		
B_Y1P	B4		FlatLink™ Channel B LVDS Data Output 1.
B_Y1N	A4		
B_Y2P	B5		FlatLink™ Channel B LVDS Data Output 2.
B_Y2N	A5		
B_Y3P	B7		FlatLink™ Channel B LVDS Data Output 3. B_Y3P and B_Y3N shall be left NC for 18 bpp panels.
B_Y3N	A7		
B_CLKP	B6		FlatLink™ Channel B LVDS Clock.
B_CLKN	A6		
RSVD1	H8	CMOS Input/Output with pulldown	Reserved. This pin should be left unconnected for normal operation.
RSVD2	B2	CMOS Input with pulldown	Reserved. This pin should be left unconnected for normal operation.
ADDR	A1	CMOS Input/Output	Local I^2C Interface Target Address Select. See Table 7-4. In normal operation this pin is an input. When the ADDR pin is programmed high, it should be tied to the same 1.8 V power rails where the SN65DSI84 VCC 1.8 V power rail is connected.
EN	B1	CMOS Input with pullup (Failsafe)	Chip Enable and Reset. Device is reset (shutdown) when EN is low.
REFCLK	H2	CMOS Input (Failsafe)	Optional External Reference Clock for LVDS Pixel Clock. If an External Reference Clock is not used, this pin should be pulled to GND with an external resistor. The source of the reference clock should be placed as close as possible with a series resistor near the source to reduce EMI.
SCL	H1		Local I^2C Interface Clock.
SDA	J1	Open Drain Input/ Output (Failsafe)	Local I^2C Interface Bi-directional Data Signal.
IRQ	J9	CMOS Output	Interrupt Signal.
GND	A2, A8, B9, D5, E4, F4, F5, H9	Power Supply	Reference Ground.
VCC	A9, B8, D6, E5, E6, F6, J2		1.8 V Power Supply.
VCORE	J8		1.1 V Output from Voltage Regulator. This pin must have a 1 µF external capacitor to GND.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) (1)

		MIN	MAX	UNIT
Supply Voltage	V_{CC}	–0.3	2.175	V
Input Voltage	CMOS Input Terminals	–0.5	2.175	V
	DSI Input Terminals (DA x P/N, DB x P/N)	–0.4	1.4	V
Storage Temperature T_{stg}		–65	105	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 EDS Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins(1)	±200	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins(2)	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{CC}	VCC Power supply	165	18	195	V
V_{PSN}	Supply noise on any V_{CC} pin	$f_{(noise)}$ > 1MHz		0.05	V
T_A	Operating free-air temperature	–40		85	°C
T_{CASE}	Case temperature			92.2	°C
V_{DSI_PIN}	DSI input pin voltage range	–50		1350	mV
$f_{(I2C)}$	Local I^2C input frequency			400	kHz
f_{HS_CLK}	DSI HS clock input frequency	40		500	MHz
t_{setup}	DSI HS data to clock setup time		0.15		UI(1)
t_{hold}	DSI HS data to clock hold time; see Figure 6-4	0.15			
Z_L	LVDS output differential impedance	90		132	Ω

(1) The unit interval (UI) is one half of the period of the HS clock; at 500 MHz the minimum setup and hold time is 150 ps.

6.4 Thermal Information

THERMAL METRIC(1)		SN65DSI84 ZXH (nFBGA) 64 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	55.1	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	30.6	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	31.0	°C/W
ψ_{JT}	Junction-to-top characterization parameter	0.8	°C/W
ψ_{JB}	Junction-to-board characterization parameter	30.8	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report.

6.5 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP[1]	MAX	UNIT
V_{IL}	Low-level control signal input voltage				0.3 x VCC	V

t_3	Delay time, CLK↑ to 4th serial bit position		3/7 t_c – 0.15		3/7 t_c + 0.15	ns
t_4	Delay time, CLK↑ to 5th serial bit position		4/7 t_c – 0.15		4/7 t_c + 0.15	ns
t_5	Delay time, CLK↑ to 6th serial bit position		5/7 t_c – 0.15		5/7 t_c + 0.15	ns
t_6	Delay time, CLK↑ to 7th serial bit position		6/7 t_c – 0.15		6/7 t_c + 0.15	ns
t_r	Differential output rise-time	See Figure 6-5	180		500	ps
t_f	Differential output fall-time					
EN, ULPS, RESET						
t_{en}	Enable time from EN or ULPS	$t_{c(o)}$ = 12.9 ns			1	ms
t_{dis}	Disable time to standby				0.1	
t_{reset}	Reset time		10			ms
R_{EFCLK}						
F_{REFCLK}	REFCLK Freqeuncy. Supported frequencies: 25 MHz-154 MHz		25		154	MHz
t_r, t_f	REFCLK rise and fall time		100 ps		1ns	s
t_{pj}	REFCLK Peak-to-Peak Phase Jitter				50	ps
Duty	REFCLK Duty Cycle		40%	50%	60%	
REFCLK or DSI CLK (DACP/N, DBCP/N)						
SSC_CLKIN	SSC enabled Input CLK center spread depth (2)		0.5%	1%	2%	
	Modulation Frequency Range		30		60	KHz

(1) All typical values are at V_{CC} = 1.8 V and T_A = 25°C

(2) For EMI reduction purpose, SN65DSI84 supports the center spreading of the LVDS CLK output through the REFCLK or DSI CLK input. The center spread CLK input to the REFCLK or DSI CLK is passed through to the LVDS CLK output A_CLKP/N and/or B_CLKP/N.

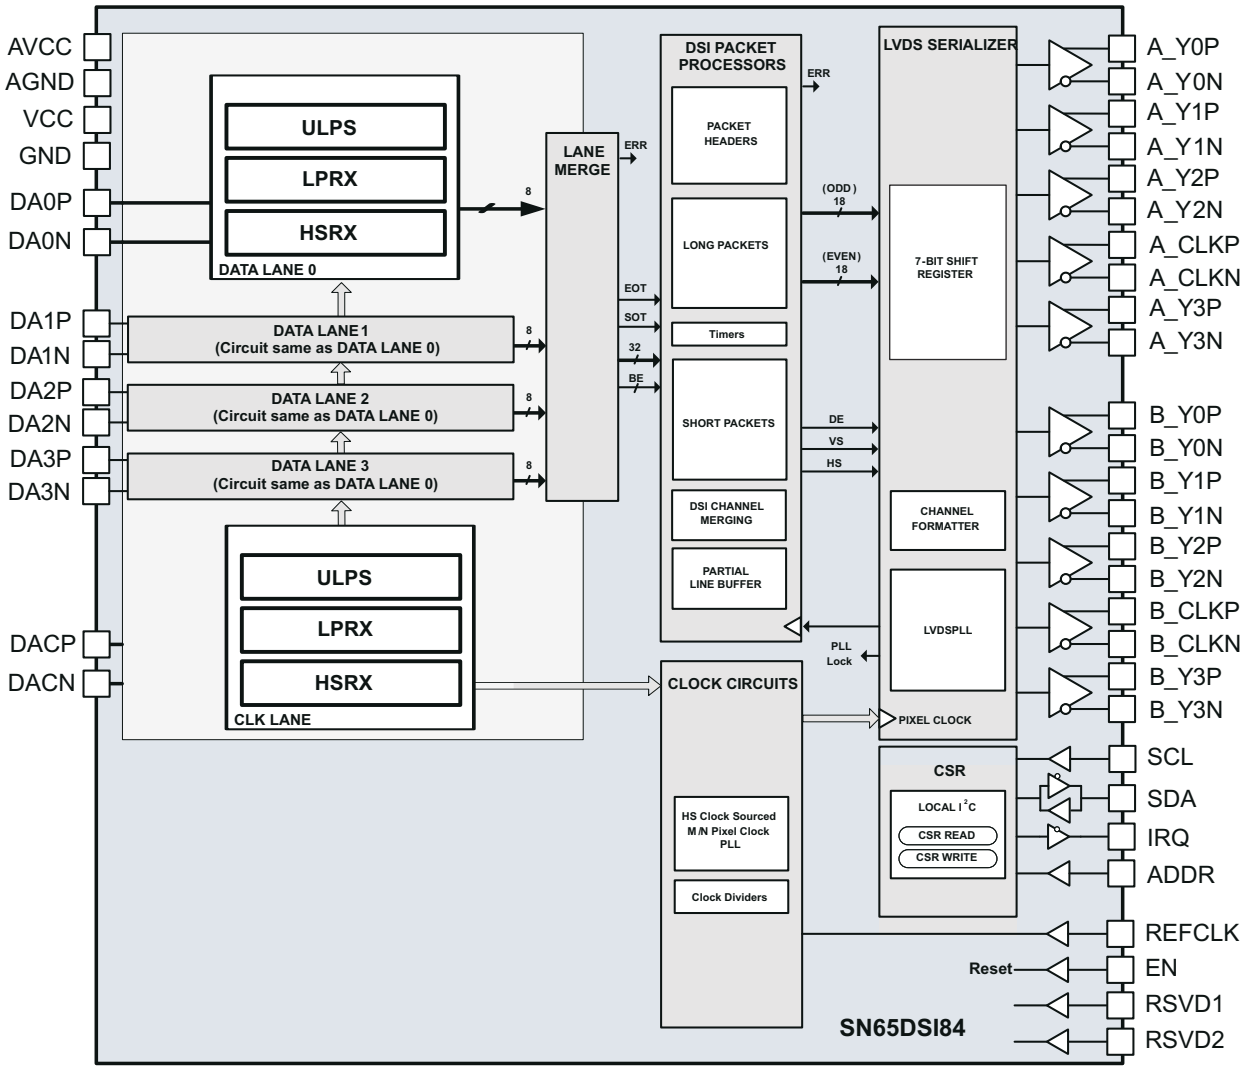
7 Detailed Description

7.1 Overview

The SN65DSI84 DSI to FlatLink bridge features a single0channel MIPI D-PHY receiver front-end configuration with 4 lanes per channel operating at 1 Gbps per lane; a maximum input bandwidth of 4 Gbps. The bridge decodes MIPI DSI 18bpp RGB666 and 240bpp RG888 packets and converts the formatted video data stream to a FlatLink compatible LVDS output operating at pixel clocks operating from 25 MHx to 154 MHz, offering a Dual-Link LVDS, Single-Link LVDS interface with four data lanes per link.

7.2 Functional Block Diagram



7.3 Feature Description

7.3.1 Clock Configurations and Multipliers

The FlatLink™ LVDS clock may be derived from the DSI channel A clock, or from an external reference clock source. When the MIPI® D-PHY channel A HS clock is used as the LVDS clock source, the D-PHY clock lane must operate in HS free-running (continuous) mode; this feature eliminates the need for an external reference clock reducing system costs

The reference clock source is selected by HS_CLK_SRC (CSR 0x0A.0) programmed through the local I^2C interface. If an external reference clock is selected, it is multiplied by the factor in REFCLK_MULTIPLIER (CSR 0x0B.1:0) to generate the FlatLink™ LVDS output clock. When an external reference clock is selected, it must be between 25 MHz and 154 MHz. If the DSI channel A clock is selected, it is divided by the factor in DSI_CLK_DIVIDER (CSR 0x0B.7:3) to generate the FlatLink™ LVDS output clock. Additionally, LVDS_CLK_RANGE (CSR 0x0A.3:1) and CH_DSI_CLK_RANGE(CSR 0x12) must be set to the frequency range of the FlatLink™ LVDS output clock for and DSI Channel A input clock respectively the internal PLL to operate correctly. After these settings are programmed, PLL_EN (CSR 0x0D.0) must be set to enable the internal PLL.

7.3.2 ULPS

The SN65DSI84 supports the MIPI defined ultra-low power state (ULPS). While the device is in the ULPS, the CSR registers are accessible via I2C interface. ULPS sequence should be issued to all active DSI CLK and/or DSI data lanes of the enabled DSI Channels for the SN65DSI84 enter the ULPS. The Following sequence should be followed to enter and exit the ULPS.

1. Host issues a ULPS entry sequence to all DSI CLK and data lanes enabled.
2. When host is ready to exit the ULPS mode, host issues a ULPS exit sequence to all DSI CLK and data lanes that need to be active in normal operation.
3. Wait for a minimum of 3 ms.
4. Set the SOFT_RESET bit (CSR 0x09.0).
5. Device resumes normal operation.(i.e video streaming resumes on the panel).

7.3.3 LVDS Pattern Generation

The SN65DSI84 supports a pattern generation feature on LVDS Channels. This feature can be used to test the LVDS output path and LVDS panels in a system platform. The pattern generation feature can be enabled by setting the CHA_TEST_PATTERN bit at address 0x3C. No DSI data is received while the pattern generation feature is enabled.

There are three modes available for LVDS test pattern generation. The mode of test pattern generation is determined by register configuration as shown in Table 7-1.

Table 7-1. Video Registers

Addr. bit	Register Name

7.4 Device Functional Modes

7.4.1 Reset Implementation

When EN is de-asserted (low), the SN65DSI84 is in SHUTDOWN or RESET state. In this state, CMOS inputs are ignored, the MIPI® D-PHY inputs are disabled and outputs are high impedance. It is critical to transition the EN input from a low to a high level after the V_{CC} supply has reached the minimum operating voltage as shown in Figure 7-1. This is achieved by a control signal to the EN input, or by an external capacitor connected between EN and GND.

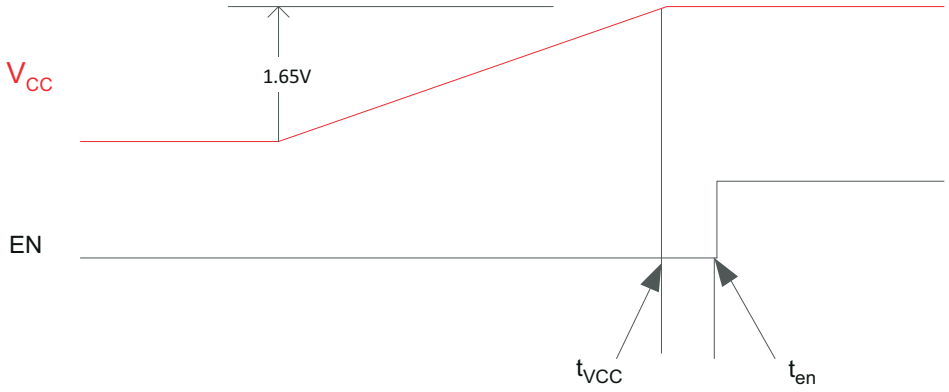

Figure 7-1. Cold Start V_{CC} Ramp up to EN

When implementing the external capacitor, the size of the external capacitor depends on the power up ramp of the V_{CC} supply, where a slower ramp-up results in a larger value external capacitor. See the latest reference schematic for the SN65DSI84 device and, or consider approximately 200 nF capacitor as a reasonable first estimate for the size of the external capacitor.

Both EN implementations are shown in Figure 7-2 and Figure 7-3.

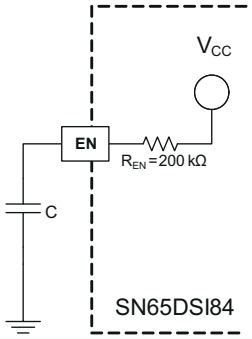

Figure 7-2. External Capacitor Controlled EN

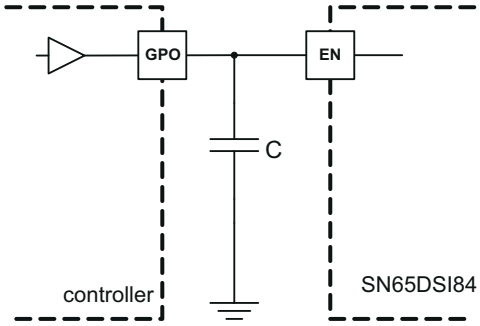

Figure 7-3. EN Input From Active Controller

7.4.2

When the SN65DSI84 is reset while V_{CC} is high, the EN pin must be held low for at least 10 ms before being asserted high as described in Table 7-2 to be sure that the device is properly reset. The DSI CLK lane MUST be in HS and the DSI data lanes MUST be driven to LP11 while the device is in reset before the EN pin is asserted per the timing described in Table 7-2.

7.4.3 Initialization Sequence

Use the following initialization sequence to setup the SN65DSI84. This sequence is required for proper operation of the device. Steps 9 through 11 in the sequence are optional.

Also see to Figure 7-1.

Table 7-2. Initialization Sequence

INITIALIZATION SEQUENCE NUMBER	INITIALIZATION SEQUENCE DESCRIPTION
Init seq 1	Power on
Init seq 2	After power is applied and stable, the DSI CLK lanes MUST be in HS state and the DSI data lanes MUST be driven to LP11 state
Init seq 3	Set EN pin to Low
Wait 10 ms (1)	
Init seq 4	Tie EN pin to High
Wait 10 ms (1)	
Init seq 5	Initialize all CSR registers to their appropriate values based on the implementation (The SN65DSI8x is not functional until the CSR registers are initialized)
Init seq 6	Set the PLL_EN bit (CSR 0x0D.0)
Wait 10 ms (1)	
Init seq 7	Set the SOFT_RESET bit (CSR 0x09.0)
Wait 10 ms (1)	
Init seq 8	Change DSI data lanes to HS state and start DSI video stream
Wait 5 ms (1)	
Init seq 9	Read back all resisters and confirm they were correctly written
Init seq 10	Write 0xFF to CSR 0xE5 to clear the error registers
Wait 1 ms (1)	
Init seq 11	Read CSR 0xE5. If CSR 0xE5!= 0x00, then go back to step #2 and re-initialize

(1) Minimum recommended delay. It is fine to exceed these.

7.4.4 LVDS Output Formats

The SN65DSI84 processes DSI packets and produces video data driven to the FlatLink™ LVDS interface in an industry standard format. Single-Link LVDS and Dual-Link LVDS are supported by the SN65DSI84; when the FlatLink™ output is implemented in a Dual-Link configuration, channel A carries the odd pixel data, and channel B carries the even pixel data. During conditions such as the default condition, and some video synchronization periods, where no video stream data is passing from the DSI input to the LVDS output, the SN65DSI84 transmits zero value pixel data on the LVDS outputs while maintaining transmission of the vertical sync and horizontal sync status.

Figure 7-4 illustrates a Single-Link LVDS 18bpp application.

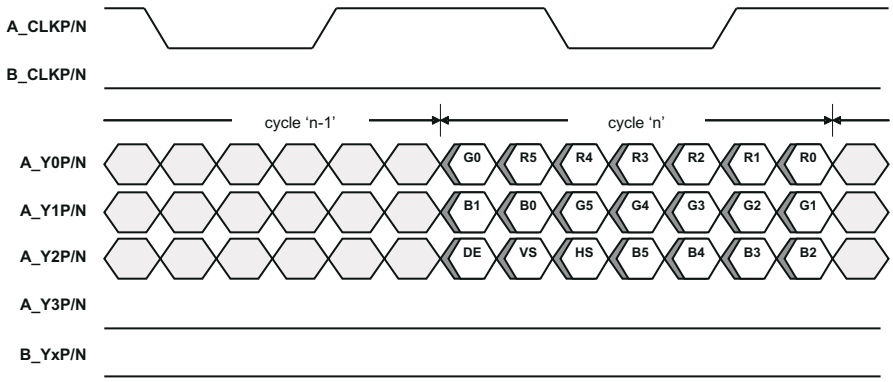
Figure 7-5 illustrates a Dual-Link 24 bpp application using Format 2, controlled by CHA_24BPP_FORMAT1 (CSR 0x18.1) and CHB_24BPP_FORMAT1 (CSR 0x18.0). In data Format 2, the two MSB per color are transferred on the Y3P/N LVDS lane.

Figure 7-6 illustrates a 24 bpp Single-Link application using Format 1. In data Format 1, the two LSB per color are transferred on the Y3P/N LVDS lane.

Figure 7-7 illustrates a Single-Link LVDS application where 24 bpp data is received from DSI and converted to 18 bpp data for transmission to an 18 bpp panel. This application is configured by setting CHA_24BPP_FORMAT1 (CSR 0x18.1) to ‘1’ and CHA_24BPP_MODE (CSR 0x18.3) to ‘0’. In this configuration, the SN65DSI84 will not transmit the 2 LSB per color since the Y3P/N LVDS lane is disabled.

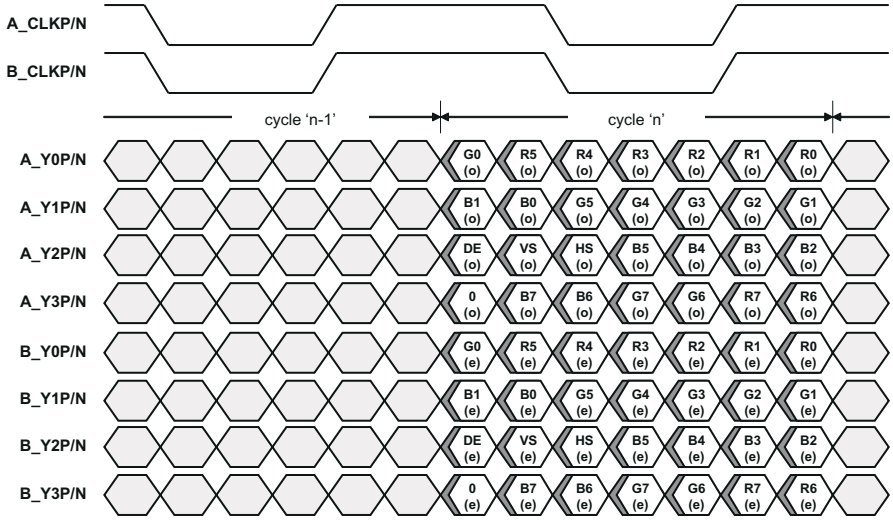
Note

Note: Figure 7-4, Figure 7-5, Figure 7-6, and Figure 7-7 only illustrate a few example applications for the SN65DSI84. Other applications are also supported.



DE = Data Enable; Channel B Clock, Channel B Data, and A_Y3P/N are Output Low

Figure 7-4. Flatlink Output Data; Single-Link 18 Bpp



DE = Data Enable; (o) = Odd Pixels; (e) = Even Pixels

Figure 7-7. Flatlink Output Data (Format 1); 24-Bpp to Single-Link 18-Bpp Conversion

7.4.5 DSI Lane Merging

The SN65DSI84 supports four DSI data lanes per input channel, and may be configured to support one, two, or three DSI data lanes per channel. Unused DSI input pins on the SN65DSI84 should be left unconnected or driven to LP11 state. The bytes received from the data lanes are merged in HS mode to form packets that carry the video stream. DSI data lanes are bit and byte aligned.

Figure 7-8 illustrates the lane merging function for each channel; 4-Lane, 3-Lane, and 2-Lane modes are illustrated

Figure 7-8. SN65DSI84 DSI Lane Merging Illustration

7.4.6 DSI Pixel Stream Packets

The SN65DSI84 processes 18bpp (RGB666) and 24 bpp (RGB888) DSI packets on each channel as shown in Figure 7-9, Figure 7-10, andFigure 7-11.

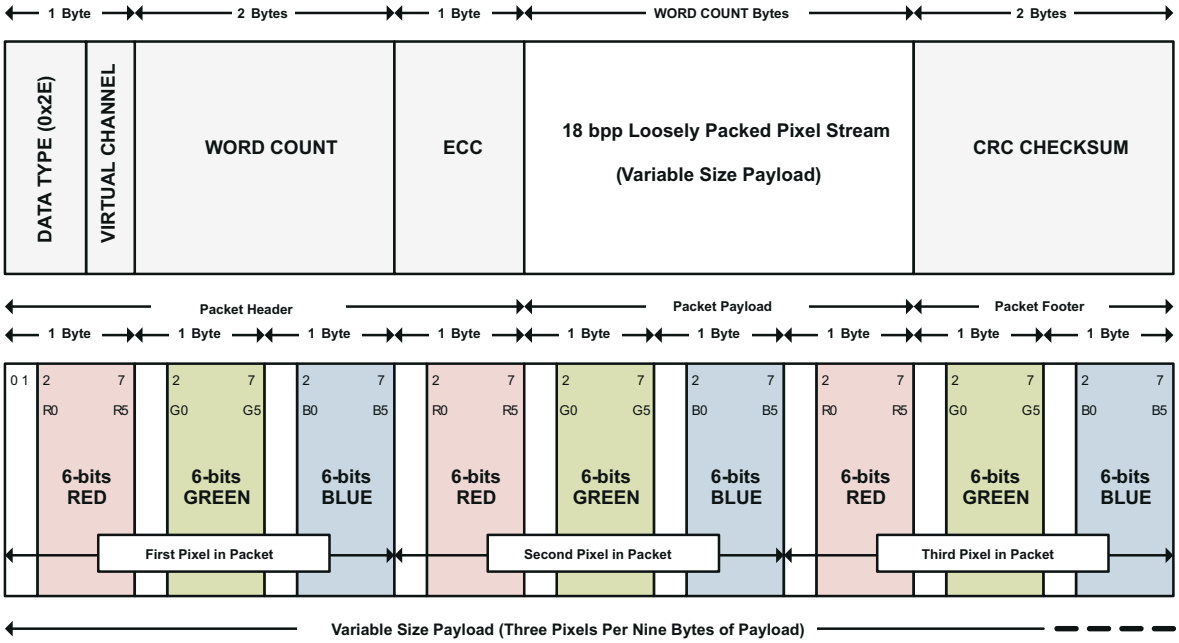

Figure 7-9. 18 Bpp (Loosely Packed) DSI Packet Structure

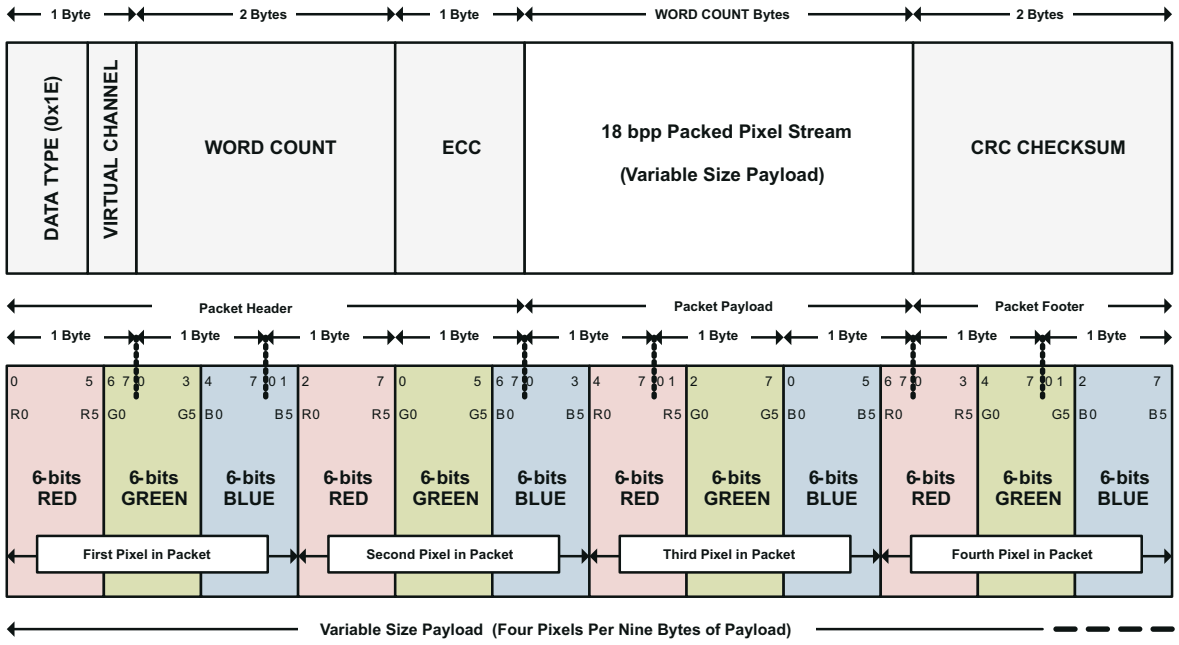

Figure 7-10. 18-Bpp (Tightly Packed) DSI Packet Structure

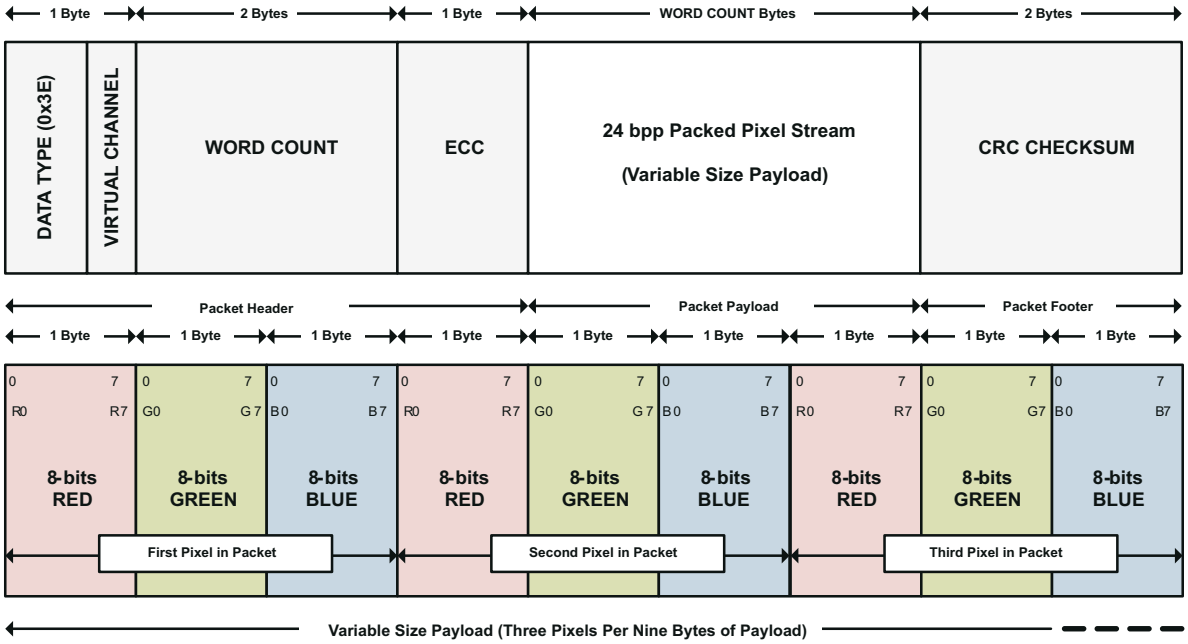

Figure 7-11. 24-Bpp DSI Packet Structure

7.4.7 DSI Video Transmission Specifications

The SN65DSI84 supports burst video mode and non-burst video mode with sync events or with sync pulses packet transmission as described in the DSI specification. The burst mode supports time-compressed pixel stream packets that leave added time per scan line for power savings LP mode. The SN65DSI84 requires a transition to LP mode once per frame to enable PHY synchronization with the DSI host processor; however, for a robust and low-power implementation, the transition to LP mode is recommended on every video line.

Figure 7-12 illustrates the DSI video transmission applied to SN65DSI84 applications. In all applications, the LVDS output rate must be less than or equal to the DSI input rate. The first line of a video frame shall start with a VSS packet, and all other lines start with VSE or HSS. The position of the synchronization packets in time is of utmost importance since this has a direct impact on the visual performance of the display panel; that is, these packets generate the HS and VS (horizontal and vertical sync) signals on the LVDS interface after the delay programmed into CHA_SYNC_DELAY_LOW/HIGH (CSR 0x28.7:0 and 0x29.3:0).

As required in the DSI specification, the SN65DSI84 requires that pixel stream packets contain an integer number of pixels (i.e. end on a pixel boundary); it is recommended to transmit an entire scan line on one pixel stream packet. When a scan line is broken in to multiple packets, inter-packet latency shall be considered such that the video pipeline (ie. pixel queue or partial line buffer) does not run empty (i.e. under-run); during scan line processing, if the pixel queue runs empty, the SN65DSI84 transmits zero data (18'b0 or 24'b0) on the LVDS interface.

Note

When the HS clock is used as a source for the LVDS pixel clock, the LP mode transitions apply only to the data lanes, and the DSI clock lane remains in the HS mode during the entire video transmission.

The DSI84 does not support the DSI Virtual Channel capability or reverse direction (peripheral to processor) transmissions.

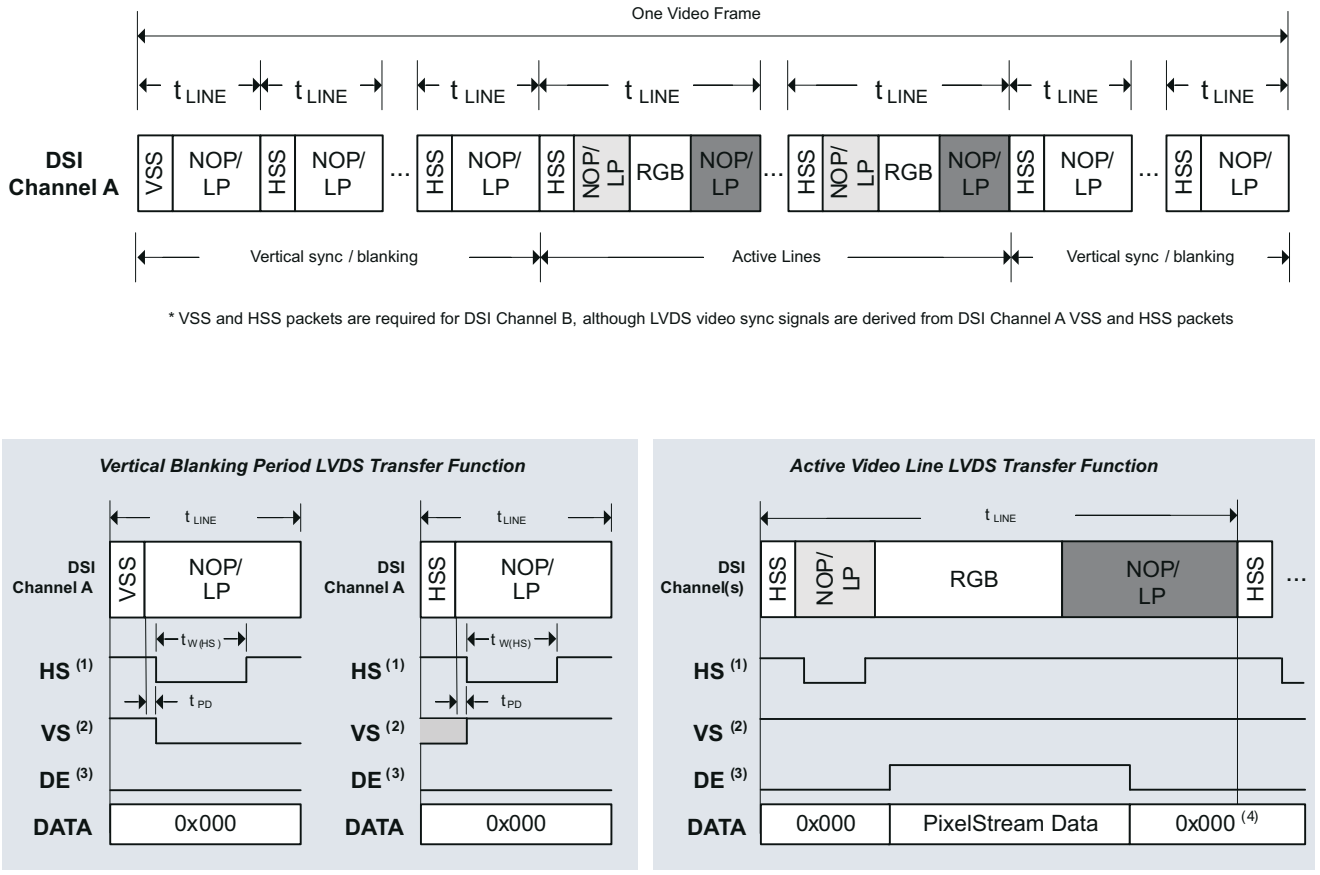

Figure 7-12. DSI Channel Transmission and Transfer Function

7.4.8 Operating Modes

The SN65DSI84 can be configured for several different operating modes via LVDS_LINK_CFG (CSR 0x18.4), LEFT_RIGHT_PIXELS (CSR 0x10.7), and DSI_CHANNEL_MODE (CSR 0x10.6:5). These modes are summarized in Table 7-3. In each of the modes, video data can be 18 bpp or 24 bpp.

Table 7-3. SN65DSI84 Operating Modes

MODE	CSR 0x18.4 LVDS_LINK_CFG	DESCRIPTION
Single DSI Input to Single-Link LVDS	1	Single DSI Input on Channel A to Single-Link LVDS output on Channel A.
Single DSI Input to Dual-Link LVDS	0	Single DSI Input on Channel A to Dual-Link LVDS output with Odd pixels on Channel A and Even pixels on Channel B.

7.5 Programming

7.5.1 Local I²C Interface Overview

The SN65DSI84 local I²C interface is enabled when EN is input high, access to the CSR registers is supported during ultra-low power state (ULPS). The SCL and SDA terminals are used for I²C clock and I²C data respectively. The SN65DSI84 I²C interface conforms to the two-wire serial interface defined by the I²C Bus Specification, Version 2.1 (January 2000), and supports fast mode transfers up to 400 kbps.

The device address byte is the first byte received following the START condition from the master device. The 7 bit device address for SN65DSI84 is factory preset to 010110X with the least significant bit being determined by the ADDR control input. Table 7-4 clarifies the SN65DSI84 target address.

Table 7-4. SN65DSI84 I²C Target Address Description (1) (2)

SN65DSI84 I2C TARGET ADDRESS							
BIT 7 (MSB)	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0 (W/R)
0	1	0	1	1	0	ADDR	0/1

(1) When ADDR=1, Address Cycle is 0x5A (Write) and 0x5B (Read)
(2) When ADDR=0, Address Cycle is 0x58 (Write) and 0x59 (Read)

The following procedure is followed to write to the SN65DSI84 I²C registers.

1. The master initiates a write operation by generating a start condition (S), followed by the SN65DSI84 7-bit address and a zero-value “W/R” bit to indicate a write cycle.
2. The SN65DSI84 acknowledges the address cycle.
3. The master presents the sub-address (I2C register within SN65DSI84) to be written, consisting of one byte of data, MSB-first.
4. The SN65DSI84 acknowledges the sub-address cycle.
5. The master presents the first byte of data to be written to the I²C register.
6. The SN65DSI84 acknowledges the byte transfer.
7. The master may continue presenting additional bytes of data to be written, with each byte transfer completing with an acknowledge from the SN65DSI84.
8. The master terminates the write operation by generating a stop condition (P).

The following procedure is followed to read the SN65DSI84 I²C registers:

1. The master initiates a read operation by generating a start condition (S), followed by the SN65DSI84 7-bit address and a one-value “W/R” bit to indicate a read cycle.
2. The SN65DSI84 acknowledges the address cycle.
3. The SN65DSI84 transmit the contents of the memory registers MSB-first starting at register 00h. If a write to the SN65DSI84 I2C register occurred prior to the read, then the SN65DSI84 will start at the sub-address specified in the write.
4. The SN65DSI84 will wait for either an acknowledge (ACK) or a not-acknowledge (NACK) from the master after each byte transfer; the I2C master acknowledges reception of each data byte transfer.
5. If an ACK is received, the SN65DSI84 transmits the next byte of data.
6. The master terminates the read operation by generating a stop condition (P).

The following procedure is followed for setting a starting sub-address for I²C reads:

1. The master initiates a write operation by generating a start condition (S), followed by the SN65DSI84 7-bit address and a zero-value “W/R” bit to indicate a write cycle
2. The SN65DSI84 acknowledges the address cycle.
3. The master presents the sub-address (I²C register within SN65DSI84) to be written, consisting of one byte of data, MSB-first.
4. The SN65DSI84 acknowledges the sub-address cycle.
5. The master terminates the write operation by generating a stop condition (P).

7.6 Register Maps

7.6.1 Control and Status Registers Overview

Many of the SN65DSI84 functions are controlled by the Control and Status Registers (CSR). All CSR registers are accessible through the local I^2C interface.

See the following tables for the SN65DSI84 CSR descriptions. Reserved or undefined bit fields should not be modified. Otherwise, the device may operate incorrectly.

Table 7-5. CSR Bit Field Definitions – ID Registers

ADDRESS	BIT(S)	DESCRIPTION	DEFAULT	ACCESS(1)
0x00 – 0x08	7:0	Reserved Addresses 0x08 - 0x00 = {0x01, 0x20, 0x20, 0x20, 0x44, 0x53, 0x49, 0x38, 0x35}	Reserved	RO

(1) RO = Read Only; RW = Read/Write; RW1C = Read/Write '1' to Clear; WO = Write Only (reads return undetermined values)

Table 7-6. CSR Bit Field Definitions – Reset and Clock Registers

ADDRESS	BIT(S)	DESCRIPTION	DEFAULT	ACCESS (1)
0x09	0	SOFT_RESET This bit automatically clears when set to '1' and returns zeros when read. This bit must be set after the CSR's are updated. This bit must also be set after making any changes to the DIS clock rate or after changing between DSI burst and non-burst modes. 0 – No action (default) 1 – Reset device to default condition excluding the CSR bits.	0	WO
0x0A	7	PLL_EN_STAT 0 – PLL not enabled (default) 1 – PLL enabled Note: After PLL_EN_STAT = 1, wait at least 3ms for PLL to lock.	0	RO
	3:1	LVDS_CLK_RANGE This field selects the frequency range of the LVDS output clock. 000 – 25 MHz ≤ LVDS_CLK < 37.5 MHz 001 – 37.5 MHz ≤ LVDS_CLK < 62.5 MHz 010 – 62.5 MHz ≤ LVDS_CLK < 87.5 MHz 011 – 87.5 MHz ≤ LVDS_CLK < 112.5 MHz 100 – 112.5 MHz ≤ LVDS_CLK < 137.5 MHz 101 – 137.5 MHz ≤ LVDS_CLK ≤ 154 MHz (default) 110 – Reserved 111 – Reserved	101	RW
	0	HS_CLK_SRC 0 – LVDS pixel clock derived from input REFCLK (default) 1 – LVDS pixel clock derived from MIPI D-PHY channel A HS continuous clock	0	RW

Table 7-6. CSR Bit Field Definitions – Reset and Clock Registers (continued)

ADDRESS	BIT(S)	DESCRIPTION	DEFAULT	ACCESS (1)
0x0B	7:3	DSI_CLK_DIVIDER When CSR 0x0A.0 = '1', this field controls the divider used to generate the LVDS output clock from the MIPI D-PHY Channel A HS continuous clock. When CSR 0x0A.0 = '0', this field must be programmed to 00000. 00000 – LVDS clock = source clock (default) 00001 – Divide by 2 00010 – Divide by 3 00011 – Divide by 4 • • • 10111 – Divide by 24 11000 – Divide by 25 11001 through 11111 – Reserved	00000	RW
	1:0	REFCLK_MULTIPLIER When CSR 0x0A.0 = '0', this field controls the multiplier used to generate the LVDS output clock from the input REFCLK. When CSR 0x0A.0 = '1', this field must be programmed to 00. 00 – LVDS clock = source clock (default) 01 – Multiply by 2 10 – Multiply by 3 11 – Multiply by 4	00	RW
0x0D	0	PLL_EN When this bit is set, the PLL is enabled with the settings programmed into CSR 0x0A and CSR 0x0B. The PLL should be disabled before changing any of the settings in CSR 0x0A and CSR 0x0B. The input clock source must be active and stable before the PLL is enabled. 0 – PLL disabled (default) 1 – PLL enabled	0	RW

(1) RO = Read Only; RW = Read/Write; RW1C = Read/Write '1' to Clear; WO = Write Only (reads return undetermined values)

Table 7-7. CSR Bit Field Definitions – DSI Registers

ADDRESS	BIT(S)	DESCRIPTION	DEFAULT	ACCESS (1)
0x10	7	Reserved - Do not write to this field. Must remain at default.	0	RW
	6:5	Reserved - Do not write to this field. Must remain at default.	01	RW
	4:3	CHA_DSI_LANES This field controls the number of lanes that are enabled for DSI Channel A. 00 – Four lanes are enabled 01 – Three lanes are enabled 10 – Two lanes are enabled 11 – One lane is enabled (default) Note: Unused DSI input pins on the SN65DSI84 should be left unconnected.	11	RW
	0	SOT_ERR_TOL_DIS 0 – Single bit errors are tolerated for the start of transaction SoT leader sequence (default) 1 – No SoT bit errors are tolerated	0	RW
0x11	7:6	CHA_DSI_DATA_EQ This field controls the equalization for the DSI Channel A Data Lanes 00 – No equalization (default) 01 – 1 dB equalization 10 – Reserved 11 – 2 dB equalization	00	RW
	3:2	CHA_DSI_CLK_EQ This field controls the equalization for the DSI Channel A Clock 00 – No equalization (default) 01 – 1 dB equalization 10 – Reserved 11 – 2 dB equalization	00	RW

Table 7-7. CSR Bit Field Definitions – DSI Registers (continued)

Note for all video registers:

1. TEST PATTERN GENERATION PURPOSE ONLY registers are for test pattern generation use only. Others are for normal operation unless the test pattern generation feature is enabled.

Table 7-9. CSR Bit Field Definitions – Video Registers

ADDRESS	BIT(S)	DESCRIPTION	DEFAULT	ACCESS(1)
0x20	7:0	CHA_ACTIVE_LINE_LENGTH_LOW This field controls the length in pixels of the active horizontal line line that are received on DSI Channel A and output to LVDS Channel A in single LVDS Channel mode(CSR 0x18.4=1), Channel A and B in dual LVDS Channel mode(CSR 0x18.4=0). The value in this field is the lower 8 bits of the 12-bit value for the horizontal line length.	0	RW
0x21	3:0	CHA_ACTIVE_LINE_LENGTH_HIGH This field controls the length in pixels of the active horizontal line that are received on DSI Channel A and output to LVDS Channel A in single LVDS Channel mode(CSR 0x18.4=1), Channel A and B in dual LVDS Channel mode(CSR 0x18.4=0). The value in this field is the upper 4 bits of the 12-bit value for the horizontal line length.	0	RW
0x24	7:0	CHA_VERTICAL_DISPLAY_SIZE_LOW TEST PATTERN GENERATION PURPOSE ONLY. This field controls the vertical display size in lines for LVDS Channel A in single LVDS Channel mode(CSR 0x18.4=1), Channel A and B in dual LVDS Channel mode(CSR 0x18.4=0. The value in this field is the lower 8 bits of the 12-bit value for the vertical display size.	0	RW
0x25	3:0	CHA_VERTICAL_DISPLAY_SIZE_HIGH TEST PATTERN GENERATION PURPOSE ONLY. This field controls the vertical display size in lines for LVDS Channel A in single LVDS Channel mode(CSR 0x18.4=1), Channel A and B in dual LVDS Channel mode(CSR 0x18.4=0). The value in this field is the upper 4 bits of the 12-bit value for the vertical display size	0	RW
0x28	7:0	CHA_SYNC_DELAY_LOW This field controls the delay in pixel clocks from when an HSync or VSync is received on the DSI to when it is transmitted on the LVDS interface for Channel A in single LVDS Channel mode(CSR 0x18.4=1), Channel A and B in dual LVDS Channel mode(CSR 0x18.4=0). The delay specified by this field is in addition to the pipeline and synchronization delays in the SN65DSI84. The additional delay is approximately 10 pixel clocks. The Sync delay must be programmed to at least 32 pixel clocks to ensure proper operation. The value in this field is the lower 8 bits of the 12-bit value for the Sync delay.	0	RW
0x29	3:0	CHA_SYNC_DELAY_HIGH This field controls the delay in pixel clocks from when an HSync or VSync is received on the DSI to when it is transmitted on the LVDS interface for Channel A in single LVDS Channel mode(CSR 0x18.4=1), Channel A and B in dual LVDS Channel mode(CSR 0x18.4=0). The delay specified by this field is in addition to the pipeline and synchronization delays in the SN65DSI84. The additional delay is approximately 10 pixel clocks. The Sync delay must be programmed to at least 32 pixel clocks to ensure proper operation. The value in this field is the upper 4 bits of the 12-bit value for the Sync delay.	0	RW
0x2C	7:0	CHA_HSYNC_PULSE_WIDTH_LOW This field controls the width in pixel clocks of the HSync Pulse Width for LVDS Channel A in single LVDS Channel mode(CSR 0x18.4=1), Channel A and B in dual LVDS Channel mode(CSR 0x18.4=0). The value in this field is the lower 8 bits of the 10-bit value for the HSync Pulse Width.	0	RW
0x2D	1:0	CHA_HSYNC_PULSE_WIDTH_HIGH This field controls the width in pixel clocks of the HSync Pulse Width for LVDS Channel A in single LVDS Channel mode(CSR 0x18.4=1), Channel A and B in dual LVDS Channel mode(CSR 0x18.4=0). The value in this field is the upper 2 bits of the 10-bit value for the HSync Pulse Width.	0	RW

Table 7-9. CSR Bit Field Definitions – Video Registers (continued)

ADDRESS	BIT(S)	DESCRIPTION	DEFAULT	ACCESS(1)
0x30	7:0	CHA_VSYNC_PULSE_WIDTH_LOW This field controls the length in lines of the VSync Pulse Width for LVDS Channel A in single LVDS Channel mode(CSR 0x18.4=1), Channel A and B in dual LVDS Channel mode(CSR 0x18.4=0). The value in this field is the lower 8 bits of the 10-bit value for the VSync Pulse Width.	0	RW
0x31	1:0	CHA_VSYNC_PULSE_WIDTH_HIGH This field controls the length in lines of the VSync Pulse Width for LVDS Channel A in single LVDS Channel mode(CSR 0x18.4=1), Channel A and B in dual LVDS Channel mode(CSR 0x18.4=0). The value in this field is the upper 2 bits of the 10-bit value for the VSync Pulse Width.	0	RW
0x34	7:0	CHA_HORIZONTAL_BACK_PORCH This field controls the time in pixel clocks between the end of the HSync Pulse and the start of the active video data for LVDS Channel A in single LVDS Channel mode(CSR 0x18.4=1), Channel A and B in dual LVDS Channel mode(CSR 0x18.4=0).	0	RW
0x36	7:0	CHA_VERTICAL_BACK_PORCH TEST PATTERN GENERATION PURPOSE ONLY. This field controls the number of lines between the end of the VSync Pulse and the start of the active video data for LVDS Channel A in single LVDS Channel mode(CSR 0x18.4=1), Channel A and B in dual LVDS Channel mode(CSR 0x18.4=0).	0	RW
0x38	7:0	CHA_HORIZONTAL_FRONT_PORCH TEST PATTERN GENERATION PURPOSE ONLY. This field controls the time in pixel clocks between the end of the active video data and the start of the HSync Pulse for LVDS Channel A in single LVDS Channel mode(CSR 0x18.4=1), Channel A and B in dual LVDS Channel mode(CSR 0x18.4=0).	0	RW
0x3A	7:0	CHA_VERTICAL_FRONT_PORCH TEST PATTERN GENERATION PURPOSE ONLY. This field controls the number of lines between the end of the active video data and the start of the VSync Pulse for LVDS Channel A in single LVDS Channel mode(CSR 0x18.4=1), Channel A and B in dual LVDS Channel mode(CSR 0x18.4=0).	0	RW
0x3C	4	CHA_TEST_PATTERN TEST PATTERN GENERATION PURPOSE ONLY. When this bit is set, the SN65DSI84 will generate a video test pattern based on the values programmed into the Video Registers for LDS Channel A in single LVDS Channel mode(CSR 0x18.4=1), Channel A and B in dual LVDS Channel mode(CSR 0x18.4=0).	0	RW

(1) RO = Read Only; RW = Read/Write; RW1C = Read/Write ‘1’ to Clear; WO = Write Only (reads return undetermined values)

Table 7-10. CSR Bit Field Definitions – IRQ Registers

ADDRESS	BIT(S)	DESCRIPTION	DEFAULT	ACCESS (1)
0xE0	0	IRQ_EN When enabled by this field, the IRQ output is driven high to communicate IRQ events. 0 – IRQ output is high-impedance (default) 1 – IRQ output is driven high when a bit is set in registers 0xE5 that also has the corresponding IRQ_EN bit set to enable the interrupt condition	0	RW
0xE1	7	CHA_SYNCH_ERR_EN 0 – CHA_SYNCH_ERR is masked 1 – CHA_SYNCH_ERR is enabled to generate IRQ events	0	RW
	6	CHA_CRC_ERR_EN 0 – CHA_CRC_ERR is masked 1 – CHA_CRC_ERR is enabled to generate IRQ events	0	RW
	5	CHA_UNC_ECC_ERR_EN 0 – CHA_UNC_ECC_ERR is masked 1 – CHA_UNC_ECC_ERR is enabled to generate IRQ events	0	RW
	4	CHA_COR_ECC_ERR_EN 0 – CHA_COR_ECC_ERR is masked 1 – CHA_COR_ECC_ERR is enabled to generate IRQ events	0	RW
	3	CHA_LLP_ERR_EN 0 – CHA_LLP_ERR is masked 1 – CHA_ LLP_ERR is enabled to generate IRQ events	0	RW
	2	CHA_SOT_BIT_ERR_EN 0 – CHA_SOT_BIT_ERR is masked 1 – CHA_SOT_BIT_ERR is enabled to generate IRQ events	0	RW
	0	PLL_UNLOCK_EN 0 – PLL_UNLOCK is masked 1 – PLL_UNLOCK is enabled to generate IRQ events	0	RW
0xE5	7	CHA_SYNCH_ERR When the DSI channel A packet processor detects an HS or VS synchronization error, that is, an unexpected sync packet; this bit is set; this bit is cleared by writing a ‘1’ value.	0	RW1C
	6	CHA_CRC_ERR When the DSI channel A packet processor detects a data stream CRC error, this bit is set; this bit is cleared by writing a ‘1’ value.	0	RW1C
	5	CHA_UNC_ECC_ERR When the DSI channel A packet processor detects an uncorrectable ECC error, this bit is set; this bit is cleared by writing a ‘1’ value.	0	RW1C
	4	CHA_COR_ECC_ERR When the DSI channel A packet processor detects a correctable ECC error, this bit is set; this bit is cleared by writing a ‘1’ value.	0	RW1C
	3	CHA_LLP_ERR When the DSI channel A packet processor detects a low level protocol error, this bit is set; this bit is cleared by writing a ‘1’ value. Low level protocol errors include SoT and EoT sync errors, Escape Mode entry command errors, LP transmission sync errors, and false control errors. Lane merge errors are reported by this status condition.	0	RW1C
	2	CHA_SOT_BIT_ERR When the DSI channel A packet processor detects an SoT leader sequence bit error, this bit is set; this bit is cleared by writing a ‘1’ value.	0	RW1C
	0	PLL_UNLOCK This bit is set whenever the PLL Lock status transitions from LOCK to UNLOCK.	1	RW1C

(1) RO = Read Only; RW = Read/Write; RW1C = Read/Write ‘1’ to Clear; WO = Write Only (reads return undetermined values)

8 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The SN65DSI84 device is primarily targeted for portable applications such as tablets and smart phones that utilize the MIPI DSI video format. The SN65DSI84 device can be used between a GPU with DSI output and a video panel with LVDS inputs

8.1.1 Video Stop and Restart Sequence

When the system requires to stop outputting video to the display, it is recommended to use the following sequence for the SN65DSI84:

1. Clear the PLL_EN bit to 0 (CSR 0x0D.0)
2. Stop video streaming on DSI inputs
3. Drive all DSI data lanes to LP11, but keep the DSI CLK lanes in HS.

When the system is ready to restart the video streaming.

1. Start video streaming on DSI inputs.
2. Set the PLL_EN bit to 1(CSR 0x0D.0).
3. Wait for a minimum of 3 ms.
4. Set the SOFT_RESET bit(0x09.0).

8.1.2 Reverse LVDS Pin Order Option

For ease of PCB routing, the SN65DSI84 supports swapping/reversing the channel or pin order via configuration register programming. The order of the LVDS pin for LVDS Channel A or Channel B can be reversed by setting the address 0x1A bit 5 CHA_REVERSE_LVDS or bit 4 CHB_REVERSE_LVDS. The LVDS Channel A and Channel B can be swapped by setting the 0x1A.6 EVEN_ODD_SWAP bit. See the corresponding register bit definition for details.

8.1.3 IRQ Usage

The SN65DSI84 provides an IRQ pin that can be used to indicate when certain errors occur on DSI. The IRQ output is enabled through the IRQ_EN bit (CSR 0xE0.0). The IRQ pin will be asserted when an error occurs on DSI, the corresponding error enable bit is set, and the IRQ_EN bit is set. An error is cleared by writing a '1' to the corresponding error status bit.

Note

If the SOFT_RESET bit is set while the DSI video stream is active, some of the error status bits may be set.

If the DSI video stream is stopped, some of the error status bits may be set. These error status bits should be cleared before restarting the video stream.

If the DSI video stream starts before the device is configured, some of the error status bits may be set. It is recommended to start streaming after the device is correctly configured as recommended in the initialization sequence in the *Section 7.4.3* section.

8.2 Typical Application

Figure 8-1 illustrates a typical application using the SN65DSI84 for a single channel DSI receiver to interface a single-channel DSI application processor to an LVDS Dual-Link 18 bit-per-pixel panel supporting 1920 x 1200 WUXGA resolutions at 60 frames per second.

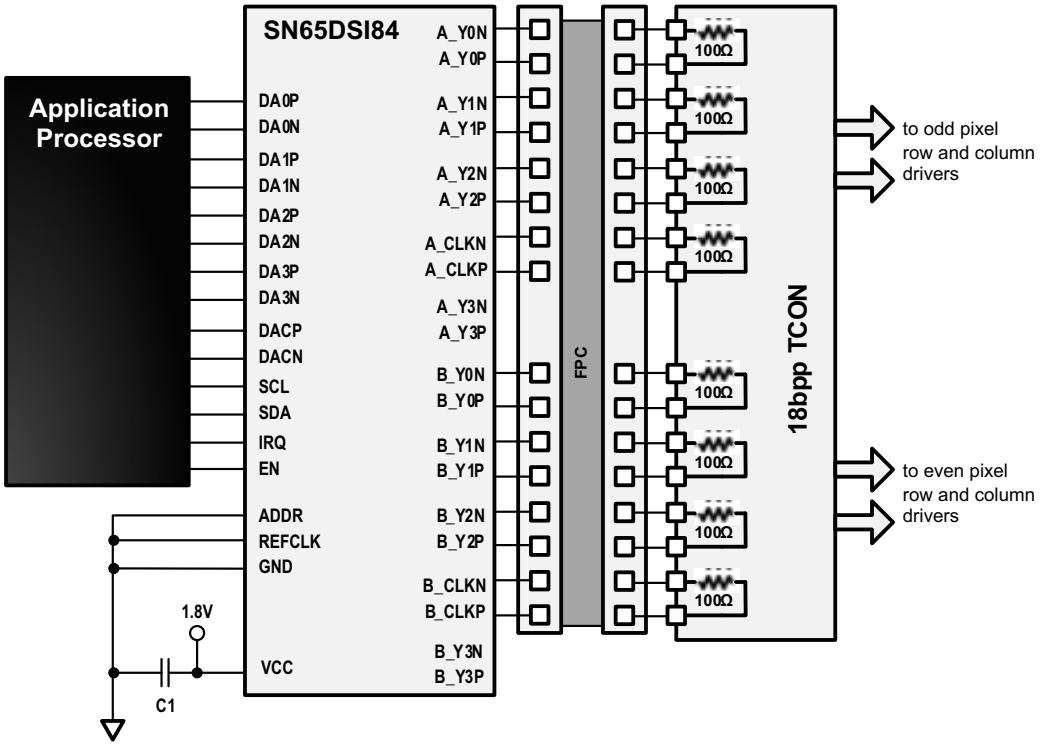

Figure 8-1. Typical 1920 x 1200 WUXGA 18-bpp Panel Application

8.2.1 Design Requirements

For the 1920 x 1200 WUXGA 18-bpp Panel typical application design parameters, see Table 8-1.

Table 8-1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
VCC	1.8V (±5%)
CLOCK	DSIA_CLK
REFCKL Frequency	N/A
DSIA Clock Frequency	490 MHz
PANEL INFORMATION	
LVDS Output Clock Frequency	81 MHz
Resolution	1920 x 1200
Horizontal Active (pixels)	960
Horizontal Blanking (pixels)	144
Vertical Active (lines)	1200
Vertical Blanking (lines)	20
Horizontal Sync Offset (pixels)	50
Horizontal Sync Pulse Width (pixels)	50
Vertical Sync Offset (lines)	1
Vertical Sync Pulse Width (lines)	5
Horizontal Sync Pulse Polarity	Negative
Vertical Sync Pulse Polarity	Negative
Color Bit Depth (6bpc or 8bpc)	6-bit
Number of LVDS Lanes	2 X [3 Data Lanes + 1 Clock Lane]
DSI INFORMATION	
Number of DSI Lanes	1 X [4 Data Lanes + 1 Clock Lane]

Table 8-1. Design Parameters (continued)

DESIGN PARAMETER	EXAMPLE VALUE
DSI Input Clock Frequency	490MHz
Dual DSI Configuration(Odd/Even or Left/Right)	N/A

8.2.2 Detailed Design Procedure

The video resolution parameters required by the panel need to be programmed into the SN65DSI84. For this example, the parameters programmed would be the following:

Horizontal active = 1920 or 0x780
CHA_ACTIVE_LINE_LENGTH_LOW = 0X80
CHA_ACTIVE_LINE_LENGTH_HIGH = 0x07

Horizontal pulse Width = 50 or 0x32
CHA_HSYNC_PULSE_WIDTH_LOW = 0x32
CHA_HSYNC_PULSE_WIDTH_HIGH= 0x00

Horizontal back porch = Horizontal blanking – (Horizontal sync offset + Horizontal sync pulse width)
Horizontal back porch = 144– (50 + 50)
Horizontal back porch = 44 or 0x2C
CHA_HORIZONTAL_BACK_PORCH = 0x2C

Vertical pulse width = 5
CHA_VSYNC_PULSE_WIDTH_LOW = 0x05
CHA_VSYNC_PULSE_WIDTH_HIGH= 0x00

The pattern generation feature can be enabled by setting the CHA_TEST_PATTERN bit at address 0x3C and configuring the following TEST PATTERN GENERATION PURPOSE ONLY registers.

Vertical active = 1200 or 0x4B0
CHA_VERTICAL_DISPLAY_SIZE_LOW = 0xB0
CHA_VERTICAL_DISPLAY_SIZE_HIGH = 0x04

Vertical back porch = Vertical blanking – (Vertical sync offset +Vertical sync pulse width)
Vertical back porch = 20 – (1 + 5)
Vertical back porch = 14 or 0x0E
CHA_VERTICAL_BACK_PORCH = 0x0E

Horizontal front porch = Horizontal sync offset
Horizontal front porch = 50 or 0x32
CHA_HORIZONTAL_FRONT_PORCH = 0x32

Vertical front porch = Vertical sync offset
Vertical front porch =1
CHA_VERTICAL_FRONT_PORCH = 0x01

In this example, the clock source for the SN65DSI84 is the DSI clock. When the MIPI D-PHY clock is used as the LVDS clock source, it is divided by the factor in DSI_CLK_DIVIDER (CSR 0x0B.7:3) to generate the FlatLink LVDS output clock. Additionally, LVDS_CLK_RANGE (CSR 0x0A.3:1) and CH_DSI_CLK_RANGE(CSR 0x12) must be set to the frequency range of the FlatLink LVDS output clock and DSI Channel A input clock respectively for the internal PLL to operate correctly. After these settings are programmed, PLL_EN (CSR 0x0D.0) should be set to enable the internal PLL.

LVDS_CLK_RANGE = 010b-62.5 MHz ≤ LVDS_CLK < 87.5 MHz
HS_CLK_SRC = 1 – LVDS pixel clock derived from MIPI D-PHY channel A HS continuous clock
DSI_CLK_DIVIDER = 0010b – Divide by 6
CHA_DSI_LANES = 00 – Four lanes are enabled
CHA_DSI_CLK_RANGE = 0x62 – 490 MHz ≤ frequency < 495 MHz

8.2.2.1 Example Script

This example configures the SN65DSI84 for the following configuration:

```
<aardvark>
<configure i2c="1" spi="1" gpio="0" tpower="1" pullups="1"/>
<i2c_bitrate khz="100"/>
```

```

9 Power Supply Recommendations

9.1 V_{CC} Power Supply

Each VCC power supply pin must have a 100-nF capacitor to ground connected as close as possible to the SN65DSI83 device. It is recommended to have one bulk capacitor (1 µF to 10 µF) on it. It is also recommended to have the pins connected to a solid power plane.

9.2 VCORE Power Supply

This pin must have a 100-nF capacitor to ground connected as close as possible to the SN65DSI83 device. It is recommended to have one bulk capacitor (1 µF to 10 µF) on it. It is also recommended to have the pins connected to a solid power plane.

10 Layout

10.1 Layout Guidelines

10.1.1 Package Specific

For the ZXH package, to minimize the power supply noise floor, provide good decoupling near the SN65DSI83 device power pins. The use of four ceramic capacitors (2 × 0.1 µF and 2 × 0.01 µF) provides good performance. At the least, TI recommends to install one 0.1-µF and one 0.01-µF capacitor near the SN65DSI83 device. To avoid large current loops and trace inductance, the trace length between decoupling capacitor and device power inputs pins must be minimized. Placing the capacitor underneath the SN65DSI83 device on the bottom of the PCB is often a good choice.

10.1.2 Differential Pairs

- Differential pairs must be routed with controlled 100-Ω differential impedance (± 20%) or 50-Ω single-ended impedance (±15%).
- Keep away from other high speed signals
- Keep lengths to within 5 mils of each other.
- Length matching must be near the location of mismatch.
- Each pair must be separated at least by 3 times the signal trace width.
- The use of bends in differential traces must be kept to a minimum. When bends are used, the number of left and right bends must be as equal as possible and the angle of the bend must be ≥ 135 degrees. This arrangement minimizes any length mismatch caused by the bends and therefore minimizes the impact that bends have on EMI.
- Route all differential pairs on the same of layer.
- The number of vias must be kept to a minimum. It is recommended to keep the via count to 2 or less.
- Keep traces on layers adjacent to ground plane.
- Do NOT route differential pairs over any plane split.
- Adding Test points will cause impedance discontinuity and will therefore negatively impact signal performance. If test points are used, they must be placed in series and symmetrically. They must not be placed in a manner that causes a stub on the differential pair.

10.1.3 Ground

TI recommends that only one board ground plane be used in the design. This provides the best image plane for signal traces running above the plane. The thermal pad of the SN65DSI83 must be connected to this plane with vias.

11 Device and Documentation Support

11.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on Alert me to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

11.2 Community Resources

11.3 Trademarks

FlatLink™ is a trademark of Texas Instruments.
MIPI® is a registered trademark of Arasan Chip Systems, Inc.
All trademarks are the property of their respective owners.

Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
SN65DSI84ZXHR	ACTIVE	NFBGA	ZXH	64	2500	RoHS & Green	SNAGCU	Level-3-260C-168 HR	-40 to 85	DSI84	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

OTHER QUALIFIED VERSIONS OF SN65DSI84 :

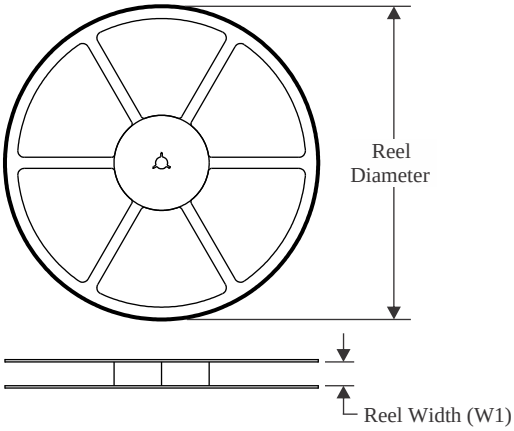
- Automotive : SN65DSI84-Q1

NOTE: Qualified Version Definitions:

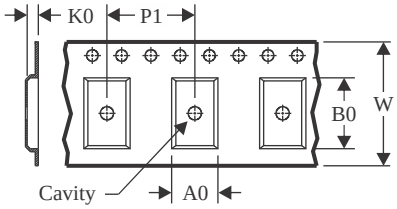
- Automotive - Q100 devices qualified for high-reliability automotive applications targeting zero defects

TAPE AND REEL INFORMATION

REEL DIMENSIONS

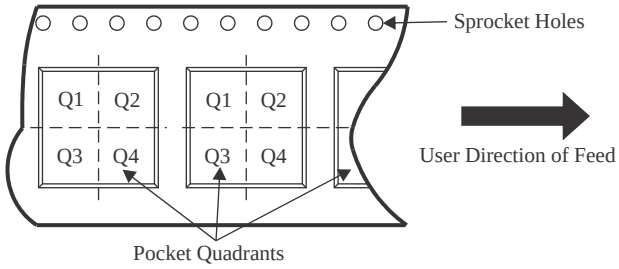


TAPE DIMENSIONS



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE



*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
