3 Design \& development

## SNx4HC74 Dual D-Type Positive-Edge-Triggered Flip-Flops With Clear and Preset

## 1 Features

- Buffered inputs
- Wide operating voltage range: 2 V to 6 V
- Wide operating temperature range: $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$
- Supports fanout up to 10 LSTTL loads
- Significant power reduction compared to LSTTL logic ICs

## 2 Applications

- Convert a momentary switch to a toggle switch
- Divide a clock signal by 2 or 4

## 3 Description

The SNx4HC74 devices contain two independent D-type positive-edge-triggered flip-flops with asynchronous preset and clear pins for each.

Device Information ${ }^{(1)}$

| PART NUMBER | PACKAGE | BODY SIZE (NOM) |
| :--- | :--- | :--- |
| SN74HC74D | SOIC (14) | $8.70 \mathrm{~mm} \times 3.90 \mathrm{~mm}$ |
| SN74HC74DB | SSOP (14) | $6.50 \mathrm{~mm} \times 5.30 \mathrm{~mm}$ |
| SN74HC74N | PDIP (14) | $19.30 \mathrm{~mm} \times 6.40 \mathrm{~mm}$ |
| SN74HC74NS | SO (14) | $10.20 \mathrm{~mm} \times 5.30 \mathrm{~mm}$ |
| SN74HC74PW | TSSOP (14) | $5.00 \mathrm{~mm} \times 4.40 \mathrm{~mm}$ |
| SN54HC74J | CDIP (14) | $21.30 \mathrm{~mm} \times 7.60 \mathrm{~mm}$ |
| SN54HC74W | CFP (14) | $9.20 \mathrm{~mm} \times 6.29 \mathrm{~mm}$ |
| SN54HC74FK | LCCC $(20)$ | $8.90 \mathrm{~mm} \times 8.90 \mathrm{~mm}$ |

(1) For all available packages, see the orderable addendum at the end of the data sheet.

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ${ }^{(1)}$

|  |  | MIN | MAX | UNIT |
| :--- | :--- | ---: | :---: | :---: |
| $V_{\mathrm{CC}}$ | Supply voltage | -0.5 | 7 | V |
| $\mathrm{I}_{\mathrm{IK}}$ | Input clamp current ${ }^{(2)}$ | $\mathrm{V}_{1}<-0.5 \mathrm{~V}$ or $\mathrm{V}_{1}>\mathrm{V}_{\mathrm{CC}}$ | $\pm 20$ | mA |
| $\mathrm{I}_{\mathrm{OK}}$ | Output clamp current ${ }^{(2)}$ | $\mathrm{V}_{1}<-0.5 \mathrm{~V}$ or $\mathrm{V}_{1}>\mathrm{V}_{\mathrm{CC}}$ | $\pm 20$ | mA |
| $\mathrm{I}_{\mathrm{O}}$ | Continuous output current | $\mathrm{V}_{\mathrm{O}}=0$ to $\mathrm{V}_{\mathrm{CC}}$ | $\pm 25$ | mA |
|  | Continuous current through $\mathrm{V}_{\mathrm{CC}}$ or GND |  | $\pm 50$ | mA |
| $\mathrm{~T}_{\mathrm{J}}$ | Junction temperature ${ }^{(3)}$ |  | 150 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\text {stg }}$ | Storage temperature | -65 | 150 | ${ }^{\circ} \mathrm{C}$ |

(1) Stresses beyond those listed under Absolute Maximum Rating may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Condition. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) The input and output voltage ratings may be exceeded if the input and output current ratings are observed.
(3) Guaranteed by design.

### 6.2 ESD Ratings

| $\mathrm{V}_{(\text {(ESD })}$ |  | Electrostatic discharge | Human-body model (HBM), per ANSI/ESDA/ <br> JEDEC JS-001(1) | $\pm 2000$ |
| :--- | :--- | :--- | :---: | :---: |

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

|  |  |  | MIN | NOM MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\mathrm{Cc}}$ | Supply voltage |  | 2 | 56 | V |
| $\mathrm{V}_{1 \mathrm{H}}$ | High-level input voltage | $\mathrm{V}_{\mathrm{CC}}=2 \mathrm{~V}$ | 1.5 |  | V |
|  |  | $\mathrm{V}_{\mathrm{CC}}=4.5 \mathrm{~V}$ | 3.15 |  |  |
|  |  | $\mathrm{V}_{\mathrm{CC}}=6 \mathrm{~V}$ | 4.2 |  |  |
| VIL | Low-level input voltage | $\mathrm{V}_{\mathrm{CC}}=2 \mathrm{~V}$ |  | 0.5 | V |
|  |  | $\mathrm{V}_{\mathrm{CC}}=4.5 \mathrm{~V}$ |  | 1.35 |  |
|  |  | $\mathrm{V}_{\mathrm{CC}}=6 \mathrm{~V}$ |  | 1.8 |  |
| $V_{1}$ | Input voltage |  | 0 | $\mathrm{V}_{\mathrm{CC}}$ | V |
| $\mathrm{V}_{\mathrm{O}}$ | Output voltage |  | 0 | $\mathrm{V}_{\mathrm{CC}}$ | V |
| $\Delta t / \Delta v$ | Input transition rise and fall rate | $\mathrm{V}_{\mathrm{CC}}=2 \mathrm{~V}$ |  | 1000 | ns |
|  |  | $\mathrm{V}_{\mathrm{CC}}=4.5 \mathrm{~V}$ |  | 500 |  |
|  |  | $\mathrm{V}_{\mathrm{CC}}=6 \mathrm{~V}$ |  | 400 |  |
| $\mathrm{T}_{\text {A }}$ | Operating free-air temperature | SN54HC00 | -55 | 125 | ${ }^{\circ} \mathrm{C}$ |
|  |  | SN74HC00 | -40 | 85 |  |

## 7 Parameter Measurement Information

- Phase relationships between waveforms were chosen arbitrarily. All input pulses are supplied by generators having the following characteristics: $\mathrm{PRR} \leq 1 \mathrm{MHz}, \mathrm{Z}_{\mathrm{O}}=50 \Omega, \mathrm{t}_{\mathrm{t}}<6 \mathrm{~ns}$.
- The outputs are measured one at a time, with one input transition per measurement.

A. $\mathrm{C}_{\mathrm{L}}=50 \mathrm{pF}$ and includes probe and jig capacitance

## 8 Detailed Description

### 8.1 Overview

The SNx4HC74 devices contain two independent D-type positive-edge-triggered flip-flops with asynchronous preset and clear pins for each.

### 8.2 Functional Block Diagram

### 8.3 Feature Description

### 8.3.1 Balanced CMOS Push-Pull Outputs

A balanced output allows the device to sink and source similar currents. The drive capability of this device may create fast edges into light loads so routing and load conditions should be considered to prevent ringing. Additionally, the outputs of this device are capable of driving larger currents than the device can sustain without being damaged. It is important for the output power of the device to be limited to avoid damage due to over-current. The electrical and thermal limits defined in the Section 6.1 must be followed at all times.
The SN74HC74 can drive a load with a total capacitance less than or equal to the maximum load listed in the Section 6.9 connected to a high-impedance CMOS input while still meeting all of the datasheet specifications. Larger capacitive loads can be applied, however it is not recommended to exceed the provided load value. If larger capacitive loads are required, it is recommended to add a series resistor between the output and the capacitor to limit output current to the values given in the Section 6.1.

### 8.3.2 Standard CMOS Inputs

Standard CMOS inputs are high impedance and are typically modeled as a resistor from the input to ground in parallel with the input capacitance given in the Section 6.5. The worst case resistance is calculated with the maximum input voltage, given in the Section 6.1, and the maximum input leakage current, given in the Section 6.5 , using ohm's law $(R=V \div I)$.

Signals applied to the inputs need to have fast edge rates, as defined by the input transition time in the Section 6.3 to avoid excessive current consumption and oscillations. If a slow or noisy input signal is required, a device with a Schmitt-trigger input should be used to condition the input signal prior to the standard CMOS input.

### 8.3.3 Clamp Diode Structure

The inputs and outputs to this device have both positive and negative clamping diodes as depicted in Figure 8-1.

## CAUTION

Voltages beyond the values specified in the Section 6.1 table can cause damage to the device. The recommended input and output voltage ratings may be exceeded if the input and output clampcurrent ratings are observed.

Figure 8-1. Electrical Placement of Clamping Diodes for Each Input and Output

### 8.4 Device Functional Modes

Table 8-1. Function Table

| INPUTS |  |  |  | OUTPUTS |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| PRE | $\overline{\text { CLR }}$ | CLK | D | Q | $\overline{\text { Q }}$ |
| L | H | X | X | H | L |
| H | L | X | X | L | H |
| L | L | X | X | $H^{(1)}$ | $H^{(1)}$ |
| H | H | $\uparrow$ | H | H | L |
| H | H | $\uparrow$ | L | L | H |
| H | H | L | X | Q $_{0}$ | $\bar{Q}_{0}$ |

(1) This configuration is nonstable; that is, it does not persist when $\overline{\text { PRE }}$ or $\overline{\mathrm{CLR}}$ returns to its inactive (high) level.

## 9 Application and Implementation

## Note

Information in the following applications sections is not part of the TI component specification, and Tl does not warrant its accuracy or completeness. Tl's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 9.1 Application Information

Toggle switches are typically large, mechanically complex and relatively expensive. It is desirable to use a momentary switch instead because they are small, mechanically simple and low cost. Some systems require a toggle switch's functionality but are space or cost constrained and must use a momentary switch instead.

If the data input (D) of the D-type flip-flop is tied to the inverted output ( $\bar{Q}$ ), then each clock pulse will cause the value at the output (Q) to toggle. The momentary switch can be debounced and connected through a Schmitt-trigger buffer to the clock input (CLK) to toggle the output.
This application also utilizes a power-on reset circuit to ensure that the output always starts in the LOW state when power is applied.

### 9.2 Typical Application

Figure 9-1. Typical application schematic

### 9.2.1 Design Requirements

### 9.2.1.1 Power Considerations

Ensure the desired supply voltage is within the range specified in the Section 6.3. The supply voltage sets the device's electrical characteristics as described in the Section 6.5.

The supply must be capable of sourcing current equal to the total current to be sourced by all outputs of the SN74HC74 plus the maximum supply current, $\mathrm{I}_{\mathrm{C}}$, listed in the Section 6.5. The logic device can only source or sink as much current as it is provided at the supply and ground pins, respectively. Be sure not to exceed the maximum total current through GND or $\mathrm{V}_{\mathrm{Cc}}$ listed in the Section 6.1.
Total power consumption can be calculated using the information provided in CMOS Power Consumption and $\mathrm{C}_{\text {pd }}$ Calculation.
Thermal increase can be calculated using the information provided in Thermal Characteristics of Standard Linear and Logic (SLL) Packages and Devices.

## CAUTION

The maximum junction temperature, $T_{J}(\max )$ listed in the Section 6.1 , is an additional limitation to prevent damage to the device. Do not violate any values listed in the Section 6.1. These limits are provided to prevent damage to the device.

### 9.2.1.2 Input Considerations

Unused inputs must be terminated to either $\mathrm{V}_{\mathrm{CC}}$ or ground. These can be directly terminated if the input is completely unused, or they can be connected with a pull-up or pull-down resistor if the input is to be used sometimes, but not always. A pull-up resistor is used for a default state of HIGH, and a pull-down resistor is used for a default state of LOW. The resistor size is limited by drive current of the controller, leakage current into the SN74HC74, as specified in the Section 6.5 , and the desired input transition rate. A $10-\mathrm{k} \Omega$ resistor value is often used due to these factors.

The SN74HC74 has standard CMOS inputs, so input signal edge rates cannot be slow. Slow input edge rates can cause oscillations and damaging shoot-through current. The recommended rates are defined in the Section 6.3.

Refer to the Section 8.3 for additional information regarding the inputs for this device.

### 9.2.1.3 Output Considerations

The positive supply voltage is used to produce the output HIGH voltage. Drawing current from the output will decrease the output voltage as specified by the $\mathrm{V}_{\mathrm{OH}}$ specification in the Section 6.5. Similarly, the ground voltage is used to produce the output LOW voltage. Sinking current into the output will increase the output voltage as specified by the $\mathrm{V}_{\mathrm{OL}}$ specification in the Section 6.5.
Unused outputs can be left floating. Do not connect outputs directly to $\mathrm{V}_{\mathrm{CC}}$ or ground.
Refer to Section 8.3 for additional information regarding the outputs for this device.

### 9.2.1.4 Timing Considerations

The SN74HC74 is a clocked device. As such, it requires special timing considerations to ensure normal operation.

Primary timing factors to consider:

- Maximum clock frequency: the maximum operating clock frequency defined in Section 6.7 is the maximum frequency at which the device is guaranteed to function. This value refers specifically to the triggering waveform, measuring from one trigger level to the next.
- Pulse duration: ensure that the triggering event duration is larger than the minimum pulse duration, as defined in the Section 6.7.
- Setup time: ensure that the data has changed at least one setup time prior to the triggering event, as defined in the Section 6.7.
- Hold time: ensure that the data remains in the desired state at least one hold time after the triggering event, as defined in the Section 6.7.

### 9.2.2 Detailed Design Procedure

1. Add a decoupling capacitor from $V_{C C}$ to GND. The capacitor needs to be placed physically close to the device and electrically close to both the $V_{c c}$ and GND pins. An example layout is shown in the Section 11.
2. Ensure the capacitive load at the output is $\leq 70 \mathrm{pF}$. This is not a hard limit, however it will ensure optimal performance. This can be accomplished by providing short, appropriately sized traces from the SN74HC74 to the receiving device.
3. Ensure the resistive load at the output is larger than $\left(\mathrm{V}_{\mathrm{CC}} / \mathrm{I}_{\mathrm{O}}(\max )\right) \Omega$. This will ensure that the maximum output current from the Section 6.1 is not violated. Most CMOS inputs have a resistive load measured in megaohms; much larger than the minimum calculated above.
4. Thermal issues are rarely a concern for logic gates, however the power consumption and thermal increase can be calculated using the steps provided in the application report, CMOS Power Consumption and Cpd Calculation

### 9.2.3 Application Curves

D001
Figure 9-2. Waveform for non-debounced switch.

Figure 9-3. Waveform for debounced switch.

## 10 Power Supply Recommendations

The power supply can be any voltage between the minimum and maximum supply voltage rating located in the Section 6.3. Each $\mathrm{V}_{\mathrm{CC}}$ terminal should have a bypass capacitor to prevent power disturbance. A $0.1-\mu \mathrm{F}$ capacitor is recommended for this device. It is acceptable to parallel multiple bypass caps to reject different frequencies of noise. The $0.1-\mu \mathrm{F}$ and $1-\mu \mathrm{F}$ capacitors are commonly used in parallel. The bypass capacitor should be installed as close to the power terminal as possible for best results, as shown in Figure 11-1.

## 11 Layout

### 11.1 Layout Guidelines

When using multiple-input and multiple-channel logic devices inputs must not ever be left floating. In many cases, functions or parts of functions of digital logic devices are unused; for example, when only two inputs of a triple-input AND gate are used. Such unused input pins must not be left unconnected because the undefined voltages at the outside connections result in undefined operational states. All unused inputs of digital logic devices must be connected to a logic high or logic low voltage, as defined by the input voltage specifications, to prevent them from floating. The logic level that must be applied to any particular unused input depends on the function of the device. Generally, the inputs are tied to $G N D$ or $\mathrm{V}_{\mathrm{CC}}$, whichever makes more sense for the logic function or is more convenient.

### 11.2 Layout Example

### 12.2 Support Resources

TI E2E ${ }^{\text {TM }}$ support forums are an engineer's go-to source for fast, verified answers and design help - straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute Tl specifications and do not necessarily reflect TI's views; see Tl's Terms of Use.

### 12.3 Trademarks

TI E2E ${ }^{\text {TM }}$ is a trademark of Texas Instruments.
All trademarks are the property of their respective owners.

### 12.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 12.5 Glossary

TI Glossary This glossary lists and explains terms, acronyms, and definitions.

## 13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. ${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.
${ }^{(2)}$ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement
${ }^{(3)}$ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature
${ }^{(4)}$ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device
${ }^{(5)}$ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device
${ }^{(6)}$ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width

NS (R-PDSO-G**)
14-PINS SHOWN

| DIM PINS ** | 14 | 16 | 20 | 24 |
| :---: | :---: | :---: | :---: | :---: |
| A MAX | 10,50 | 10,50 | 12,90 | 15,30 |
| A MIN | 9,90 | 9,90 | 12,30 | 14,70 |

NOTES: A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Body dimensions do not include mold flash or protrusion, not to exceed 0,15.

W (R-GDFP-F14)

NOTES: A. All linear dimensions are in inches (millimeters).
B. This drawing is subject to change without notice.
C. This package can be hermetically sealed with a ceramic lid using glass frit.
D. Index point is provided on cap for terminal identification only.
E. Falls within MIL STD 1835 GDFP1-F14

This image is a representation of the package family, actual package may vary.
Refer to the product data sheet for package details.

## GENERIC PACKAGE VIEW

Images above are just a representation of the package family, actual package may vary. Refer to the product data sheet for package details.

## NOTES:

1. All controlling linear dimensions are in inches. Dimensions in brackets are in millimeters. Any dimension in brackets or parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This package is hermitically sealed with a ceramic lid using glass frit.
4. Index point is provided on cap for terminal identification only and on press ceramic glass frit seal only.
5. Falls within MIL-STD-1835 and GDIP1-T14.

D (R-PDSO-G14)
PLASTIC SMALL OUTLINE

NOTES: A. All linear dimensions are in inches (millimeters).
B. This drawing is subject to change without notice.

C Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed $0.006(0,15)$ each side.
(D) Body width does not include interlead flash. Interlead flash shall not exceed $0.017(0,43)$ each side.
E. Reference JEDEC MS-012 variation AB.

D (R-PDSO-G14)

NOTES: A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC-7351 is recommended for alternate designs.
D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

NOTES: A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
B. This drawing is subject to change without notice.

Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0,15 each side.
(D) Body width does not include interlead flash. Interlead flash shall not exceed 0,25 each side.
E. Falls within JEDEC MO-153

NOTES: A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC-7351 is recommended for alternate designs.
D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

N (R-PDIP-T**)
PLASTIC DUAL-IN-LINE PACKAGE
16 PINS SHOWN

NOTES: A. All linear dimensions are in inches (millimeters).
B. This drawing is subject to change without notice.
C) Falls within JEDEC MS-001, except 18 and 20 pin minimum body length (Dim A).

D The 20 pin end lead shoulder width is a vendor option, either half or full width.

| DIM PINS ** | $\mathbf{1 4}$ | $\mathbf{1 6}$ | $\mathbf{2 0}$ | $\mathbf{2 4}$ | $\mathbf{2 8}$ | $\mathbf{3 0}$ | $\mathbf{3 8}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| A MAX | 6,50 | 6,50 | 7,50 | 8,50 | 10,50 | 10,50 | 12,90 |
| A MIN | 5,90 | 5,90 | 6,90 | 7,90 | 9,90 | 9,90 | 12,30 |

NOTES: A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Body dimensions do not include mold flash or protrusion not to exceed 0,15.
D. Falls within JEDEC MO-150
