TPA2080D1
SLOS733B -JANUARY 2012-REVISED APRIL 2016

## TPA2080D1 2.2-W Constant Output Power Class-D Audio Amplifier With Class-G Boost Converter

## 1 Features

- 2.2 W into 4- $\Omega$ Load from 3.6-V Supply ( $1 \%$ THD +N )
- Integrated Class-G Boost Converter
- Increases Efficiency at Low Output Power
- Low Quiescent Current of 3.5 mA from 3.6 V
- Thermal and Short-Circuit Protection With Auto Recovery
- 20-dB Fixed Gain
- Available in $1.53-\mathrm{mm} \times 1.98-\mathrm{mm}, 0.5-\mathrm{mm}$ pitch 12-ball WCSP (DSBGA) Package

## 2 Applications

- Cell Phones
- PDA, GPS
- Portable Electronics and Speakers

## 3 Description

The TPA2080D1 device is a high-efficiency Class-D audio power amplifier with an integrated Class-G boost converter that enhances efficiency at low output power. It drives up to 2.2 W into an $4-\Omega$ speaker ( $1 \%$ THD+N). With 85\% typical efficiency, the TPA2080D1 helps extend battery life when playing audio.
The built-in boost converter generates a $5.75-\mathrm{V}$ supply voltage for the Class-D amplifier when high output power is required. This provides a louder audio output than a stand-alone amplifier directly connected to the battery. During low audio output power periods, the boost converter deactivates and connects VBAT directly to the Class-D amplifier supply, PVDD. This improves overall efficiency.
The TPA2080D1 has an integrated low-pass filter to improve the RF rejection and reduce DAC out-ofband noise, increasing the signal-to-noise ratio (SNR).
The TPA2080D1 is available in a space-saving $1.53-\mathrm{mm} \times 1.982-\mathrm{mm}, 0.5-\mathrm{mm}$ pitch WCSP package (YZG).

## 8 Parameter Measurement Information

All parameters are measured according to the conditions described in Specifications.

(1) The $1-\mu \mathrm{F}$ input capacitors on $\mathrm{IN}+$ and IN - were shorted for input common-mode voltage measurements.
(2) $\mathrm{A} 33-\mu \mathrm{H}$ inductor was placed in series with the load resistor to emulate a small speaker for efficiency measurements.
(3) The $30-\mathrm{kHz}$ low-pass filter is required even if the analyzer has an internal low-pass filter. An R-C low-pass filter ( $100 \Omega, 47 \mathrm{nF}$ ) is used on each output for the data sheet graphs.

Figure 20. Test Setup for Graphs

## 9 Detailed Description

### 9.1 Overview

The TPA2080D1 is a high-efficiency Class-D audio power amplifier with an integrated Class-G boost converter that enhances efficiency at low output power. The built-in converter generates a $5.75-\mathrm{V}$ supply voltage for the Class-D amplifier when high output power is required. The device has a integrated low-pass filter to improve the RF rejection and reduce DAC out-of-band noise, increasing the signal-to-noise ratio (SNR).

### 9.2 Functional Block Diagram

### 9.3 Feature Description

### 9.3.1 Fully Differential Amplifier

The TPA2080D1 is a fully differential amplifier with differential inputs and outputs. The fully differential amplifier consists of a differential amplifier with common-mode feedback. The differential amplifier ensures that the amplifier outputs a differential voltage on the output that is equal to the differential input times the gain. The common-mode feedback ensures that the common-mode voltage at the output is biased around VCC/2 regardless of the common-mode voltage at the input. The fully differential TPA2080D1 can still be used with a single-ended input; however, the TPA2080D1 must be used with differential inputs when in a noisy environment, like a wireless handset, to ensure maximum noise rejection.

### 9.3.1.1 Advantages of Fully Differential Amplifiers

- Input-coupling capacitors not required:
- The fully differential amplifier allows the inputs to be biased at voltage other than mid-supply. The inputs of

Texas
InsTRUMENTS

## Feature Description (continued)

the TPA2080D1 can be biased anywhere within the common-mode input voltage range listed in Recommended Operating Conditions and Electrical Characteristics. If the inputs are biased outside of that range, input-coupling capacitors are required.

- Midsupply bypass capacitor, $\mathrm{C}_{(\mathrm{BYPASS})}$, not required:
- The fully differential amplifier does not require a bypass capacitor. Any shift in the midsupply affects both positive and negative channels equally and cancels at the differential output.
- Better RF-immunity:
- GSM handsets save power by turning on and shutting off the RF transmitter at a rate of 217 Hz . The transmitted signal is picked up on input and output traces. The fully differential amplifier cancels the signal better than the typical audio amplifier.

### 9.3.2 Short-Circuit Auto-Recovery

When a short-circuit event happens, the TPA2080D1 goes to low duty cycle mode and tries to reactivate itself every 1.6 seconds. The auto-recovery will continue until the short-circuit event stops. This feature protects the device without affecting the long-term reliability of the device.

### 9.3.3 Operation With DACs and CODECs

Large noise voltages can be present at the output of $\triangle \Sigma$ DACs and CODECs, just above the audio frequency (for example, 80 kHz with a $300 \mathrm{mV}_{\mathrm{P}-\mathrm{p}}$ ). This out-of-band noise is due to the noise shaping of the delta-sigma modulator in the DAC. Some Class-D amplifiers have higher output noise when used in combination with these DACs and CODECs. This is because out-of-band noise from the CODEC/DAC mixes with the Class-D switching frequencies in the audio amplifier input stage. The TPA2080D1 has a built-in low-pass filter with cutoff frequency at 55 kHz that reduces the out-of-band noise and RF noise, filtering out-of-band frequencies that could degrade in-band noise performance. If driving the TPA2080D1 input with 4th-order or higher $\Delta \Sigma$ DACs or CODECs, add an R-C low pass filter at each of the audio inputs (IN+ and IN-) of the TPA2080D1 to ensure best performance. The recommended resistor value is $100 \Omega$ and the capacitor value of 47 nF .

### 9.3.4 Speaker Load Limitation

Speakers are nonlinear loads with varying impedance (magnitude and phase) over the audio frequency. A portion of speaker load current can flow back into the boost converter output through the Class-D output H-bridge high-side device. This is dependent on the phase change over frequency on the speaker, and the audio signal amplitude and frequency content. Most portable speakers have limited phase change at the resonant frequency, typically no more than 40 or 50 degrees. To avoid excess flow-back current, use speakers with limited phase change. Otherwise, flow-back current could drive the PVDD voltage above the absolute maximum recommended operational voltage.

Confirm proper operation by connecting the speaker to the TPA2080D1 and driving it at maximum output swing. Observe the PVDD voltage with an oscilloscope. In the unlikely event the PVDD voltage exceeds 6.5 V , add a $6.8-\mathrm{V}$ Zener diode between PVDD and ground to ensure the TPA2080D1 operates properly. The amplifier has thermal overload protection and deactivates if the die temperature exceeds $150^{\circ} \mathrm{C}$. It automatically reactivates once die temperature returns below $150^{\circ} \mathrm{C}$. Built-in output overcurrent protection deactivates the amplifier if the speaker load becomes short-circuited. The amplifier automatically restarts 1.6 seconds after the overcurrent event. Although the TPA2080D1 Class-D output can withstand a short between OUT+ and OUT-, do not connect either output directly to GND, VDD, or VBAT as this could damage the device.

### 9.3.5 Filter-Free Operation and Ferrite Bead Filters.

A ferrite bead filter can often be used if the design is failing radiated emissions without an LC filter and the frequency sensitive circuit is greater than 1 MHz . This filter functions well for circuits that just have to pass FCC and CE because FCC and CE only test radiated emissions greater than 30 MHz . When choosing a ferrite bead, choose one with high impedance at high frequencies, and very low impedance at low frequencies. In addition, select a ferrite bead with adequate current rating to prevent distortion of the output signal.

Use an LC output filter if there are low-frequency, ( $<1 \mathrm{MHz}$ ) EMI-sensitive circuits or long leads from amplifier to speaker.
Figure 21 shows a typical ferrite bead output filters.

## Feature Description (continued)

Figure 21. Typical Ferrite Chip Bead Filter

Table 1. Suggested Chip Ferrite Bead

| LOAD | VENDOR | PART NUMBER | SIZE |
| :---: | :---: | :---: | :---: |
| $8 \Omega$ | Murata | BLM18EG121SN1 | 0603 |
| $4 \Omega$ | TDK | MPZ2012S101A | 0805 |

### 9.3.6 Boost Converter Auto Pass Through (APT)

The TPA2080D1 consists of a Class-G boost converter and a Class-D amplifier. The boost converter operates from the supply voltage, VBAT, and generates a higher output voltage PVDD at 5.75 V . PVDD drives the supply voltage of the Class-D amplifier. This improves loudness over non-boosted solutions. The boost converter has a pass through mode in which it turns off automatically and PVDD is directly connected to VBAT through an internal bypass switch.
The boost converter is adaptive and operates between pass through mode and boost mode depending on the output audio signal amplitude. When the audio output amplitude exceeds the auto pass through (APT) threshold, the boost converter is activated automatically and goes to boost mode. The transition time from normal mode to boost mode is fast enough to prevent clipping large transient audio signals. The APT threshold of the TPA2080D1 is fixed at $2 \mathrm{~V}_{\text {PEAK }}$. When the audio output signal is below APT threshold, the boost converter is deactivated and goes to pass through mode. The adaptive boost converter maximizes system efficiency at lower audio output levels.
The Class-G boost converter is designed to drive the Class-D amplifier only. Do not use the boost converter to drive external devices.

Figure 22 shows how the adaptive boost converter behaves with a typical audio signal.

Figure 22. Class-G Boost Converter With Typical Music Playback

### 9.4 Device Functional Modes

### 9.4.1 Shutdown Mode

The TPA2080D1 can be put in shutdown mode when asserting EN to a logic LOW. While in shutdown mode, the device output stage is turned off and the current consumption is very low.

## 10 Application and Implementation

## NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. Tl's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 10.1 Application Information

These typical connection diagrams highlight the required external components and system level connections for proper operation of the device. Each of these configurations can be realized using the Evaluation Modules (EVMs) for the device. These flexible modules allow full evaluation of the device in the most common modes of operation. Any design variation can be supported by TI through schematic and layout reviews. Visit e2e.ti.com for design assistance and join the audio amplifier discussion forum for additional information.

### 10.2 Typical Application

### 10.2.1 TPA2080D1 With Differential Input Signal

Figure 23. Typical Application Schematic With Differential Input Signals

### 10.2.1.1 Design Requirements

For this design example, use the parameters listed in Table 2.
Table 2. Design Parameters

| DESIGN PARAMETER | EXAMPLE VALUE |

### 10.2.1.2 Detailed Design Procedure

### 10.2.1.2.1 Surface Mount Inductor

Working inductance decreases as inductor current increases. if the drop in working inductance is severe enough, it may cause the boost converter to become unstable, or cause the TPA2080D1 to reach its current limit at a lower output power than expected. Inductor vendors specify currents at while inductor values decrease by a specific percentage. This can vary from $10 \%$ to $35 \%$. Inductance is also affected by DC current and temperature.

### 10.2.1.2.2 Inductor Selection

Inductor current rating is determined by the requirements of the load. The inductance is determined by two factors: the minimum value required for stability and the maximum ripple current permitted in the application. Use Equation 1 to determine the required current rating. Equation 1 shows the approximate relationship between the average inductor current, $I_{L}$, to the load current, load voltage, and input voltage (lpvDD, PVDD, and VBAT, respectively). Insert $I_{\text {PVDD }}$, PVDD, and VBAT into Equation 1 and solve for $I_{L}$. The inductor must maintain at least $90 \%$ of its initial inductance value at this current.

$$
\begin{equation*}
\mathrm{L}_{\mathrm{L}}=\mathrm{I}_{\mathrm{PVDD}} \times\left(\frac{\mathrm{PVDD}}{\mathrm{VBAT} \times 0.8}\right) \tag{1}
\end{equation*}
$$

Ripple current, $\Delta \mathrm{L}_{\mathrm{L}}$, is peak-to-peak variation in inductor current. Smaller ripple current reduces core losses in the inductor and reduces the potential for EMI. Use Equation 2 to determine the value of the inductor, L. Equation 2 shows the relationship between inductance L, VBAT, PVDD, the switching frequency, $\mathrm{f}_{\text {BOost }}$, and $\Delta \mathrm{I}_{\mathrm{L}}$. Insert the maximum acceptable ripple current into Equation 2 and solve for L .

$$
\begin{equation*}
\mathrm{L}=\frac{\mathrm{VBAT} \times(\mathrm{PVDD}-\mathrm{VBAT})}{\Delta_{\mathrm{L}} \times f_{\mathrm{BOOST}} \times \mathrm{PVDD}} \tag{2}
\end{equation*}
$$

$\Delta I_{L}$ is inversely proportional to $L$. Minimize $\Delta I_{L}$ as much as is necessary for a specific application. Increase the inductance to reduce the ripple current. Do not use greater than $4.7 \mu \mathrm{H}$, as this prevents the boost converter from responding to fast output current changes properly. If using above $3.3 \mu \mathrm{H}$, then use at least $10-\mu \mathrm{F}$ capacitance on PVDD to ensure boost converter stability.
The typical inductor value range for the TPA2080D1 is $2.2 \mu \mathrm{H}$ to $3.3 \mu \mathrm{H}$. Select an inductor with less than $0.5-\Omega$ DC resistance, DCR. Higher DCR reduces total efficiency due to an increase in voltage drop across the inductor.

Table 3. Sample Inductors

| $\underset{(\mu \mathrm{H})}{\mathrm{L}}$ | SUPPLIER | COMPONENT CODE | SIZE (LxWxH mm) | DCR TYP (m $\Omega$ ) | $I_{\text {SAT }} \text { MAX }$ <br> (A) | C RANGE |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 2.2 | Chilisin Electronics Corp. | CLCN252012T-2R2M-N | $2.5 \times 2 \times 1.2$ | 105 | 1.2 | $\begin{aligned} & 10 \text { to } 22 \mu \mathrm{~F}, 16 \mathrm{~V} \\ & 10 \text { to } 22 \mu \mathrm{~F}, 10 \mathrm{~V} \end{aligned}$ |
| 2.2 | Toko | 1239AS-H-2R2N=P2 | $2.5 \times 2 \times 1.2$ | 96 | 2.3 |  |
| 2.2 | Coilcraft | XFL4020-222MEC | $4 \times 4 \times 2.15$ | 22 | 3.5 |  |
| 3.3 | Toko | 1239AS-H-3R3N=P2 | $2.5 \times 2 \times 1.2$ | 160 | 2 | 10 to $22 \mu \mathrm{~F}, 10 \mathrm{~V}$ |
| 3.3 | Coilcraft | XFL4020-332MEC | $4 \times 4 \times 2.15$ | 35 | 2.8 |  |

### 10.2.1.2.3 Surface Mount Capacitors

Temperature and applied DC voltage influence the actual capacitance of high-K materials. Table 4 shows the relationship between the different types of high-K materials and their associated tolerances, temperature coefficients, and temperature ranges. Notice that a capacitor made with X5R material can lose up to $15 \%$ of its capacitance within its working temperature range.
In an application, the working capacitance of components made with high-K materials is generally much lower than nominal capacitance. A worst-case result with a typical X5R material might be $-10 \%$ tolerance, $-15 \%$ temperature effect, and $-45 \%$ DC voltage effect at $50 \%$ of the rated voltage. This particular case would result in a working capacitance of $42 \%(0.9 \times 0.85 \times 0.55)$ of the nominal value.
Select high-K ceramic capacitors according to the following rules:

1. Use capacitors made of materials with temperature coefficients of $\mathrm{X} 5 \mathrm{R}, \mathrm{X} 7 \mathrm{R}$, or better.
2. Use capacitors with DC voltage ratings of at least twice the application voltage. Use minimum 10-V
capacitors for the TPA2080D1.
3. Choose a capacitance value at least twice the nominal value calculated for the application. Multiply the nominal value by a factor of 2 for safety. If a $10-\mu \mathrm{F}$ capacitor is required, use $20 \mu \mathrm{~F}$.
The preceding rules and recommendations apply to capacitors used in connection with the TPA2080D1. The TPA2080D1 cannot meet its performance specifications if the rules and recommendations are not followed.

Table 4. Typical Tolerance and Temperature Coefficient of Capacitance by Material

| MATERIAL | COG / NPO | X7R | X5R |
| :---: | :---: | :---: | :---: |
| Typical tolerance | $\pm 5 \%$ | $\pm 10 \%$ | $80 \%$ or $-20 \%$ |
| Temperature | $\pm 30 \mathrm{ppm}$ | $\pm 15 \%$ | $22 \%$ or $-82 \%$ |
| Temperature range ${ }^{\circ} \mathrm{C}$ | $-55^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}$ | $-55^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}$ | $-30^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$ |

### 10.2.1.2.4 Boost Converter Capacitor Selection

The value of the boost capacitor is determined by the minimum value of working capacitance required for stability and the maximum voltage ripple allowed on PVDD in the application. Working capacitance refers to the available capacitance after derating the capacitor value for DC bias, temperature, and aging. Do not use any component with a working capacitance less than $6.8 \mu \mathrm{~F}$. This corresponds to a $10-\mu \mathrm{F}, 16-\mathrm{V}$ capacitor or a $10-\mu \mathrm{F}, 10-\mathrm{V}$ capacitor.
Do not use above $22-\mu \mathrm{F}$ capacitance as it will reduce the boost converter response time to large output current transients.
Equation 3 shows the relationship between the boost capacitance, C , to load current, load voltage, ripple voltage, input voltage, and switching frequency ( $\mathrm{I}_{\mathrm{PVDD}}$, PVDD, $\Delta \mathrm{V}$, VBAT, and $\mathrm{f}_{\text {BOoSt }}$ respectively).
Insert the maximum allowed ripple voltage into Equation 3 and solve for C . The 1.5 multiplier accounts for capacitance loss due to applied DC voltage and temperature for X5R and X7R ceramic capacitors.

$$
\begin{equation*}
\mathrm{C}=1.5 \times \frac{\mathrm{I}_{\mathrm{PVDD}} \times(\mathrm{PVDD}-\mathrm{VBAT})}{\Delta \mathrm{V} \times f_{\mathrm{BOOST}} \times \mathrm{PVDD}} \tag{3}
\end{equation*}
$$

### 10.2.1.2.5 Decoupling Capacitors

The TPA2080D1 is a high-performance Class-D audio amplifier that requires adequate power supply decoupling. Adequate power supply decoupling to ensures that the efficiency is high and total harmonic distortion (THD) is low.
Place a low equivalent-series-resistance (ESR) ceramic capacitor, typically $0.1 \mu \mathrm{~F}$, within 2 mm of the VBAT ball. Use X5R and X7R ceramic capacitors. This choice of capacitor and placement helps with higher frequency transients, spikes, or digital hash on the line. Additionally, placing this decoupling capacitor close to the TPA2080D1 is important, as any parasitic resistance or inductance between the device and the capacitor causes efficiency loss. In addition to the $0.1-\mu \mathrm{F}$ ceramic capacitor, place a $2.2-\mu \mathrm{F}$ to $10-\mu \mathrm{F}$ capacitor on the VBAT supply trace. This larger capacitor acts as a charge reservoir, providing energy faster than the board supply, thus helping to prevent any droop in the supply voltage.

### 10.2.1.2.6 Input Capacitors

Input audio DC decoupling capacitors are recommended. The input capacitors and TPA2080D1 input impedance form a high-pass filter with the corner frequency, $\mathrm{f}_{\mathrm{c}}$, determined in Equation 4.
Any mismatch in capacitance between the two inputs will cause a mismatch in the corner frequencies. Severe mismatch may also cause turnon pop noise. Choose capacitors with a tolerance of $\pm 10 \%$ or better. Use X5R and X7R ceramic capacitors.

$$
\begin{equation*}
\mathrm{f}_{\mathrm{c}}=\frac{1}{\left(2 \times \pi \times R_{1} \mathrm{C}_{\mathrm{l}}\right)} \tag{4}
\end{equation*}
$$

The value of the input capacitor is important to consider as it directly affects the bass (low frequency) performance of the circuit. Speakers in wireless phones cannot usually respond well to low frequencies, so the corner frequency can be set to block low frequencies in this application. Not using input capacitors can increase output offset.

TPA2080D1

| Output Power vs Supply Voltage | Figure 1 |
| THD + N vs Frequency | Figure 5 |
| THD $+N$ vs Output Power | Figure 7 |
| Total Power Dissipation vs Output Power | Figure 11 |

### 10.2.2 TPA2080D1 With Single-Ended Signals.

Figure 24. Typical Application Schematic With Single-Ended Input Signal

### 10.2.2.1 Design Requirements

For this design example, use the parameters listed in Table 2.

### 10.2.2.2 Detailed Design Procedure

For the design procedure see Detailed Design Procedure.

### 10.2.2.3 Application Curves

For application curves, see the figures listed in Table 6.

## 11 Power Supply Recommendations

The TPA2080D1 is designed to operate from an input voltage supply range from 2.5 V to 5.2 V . Therefore the output voltage range of the power supply should be within this range. The current capability of upper power must not exceed the maximum current limit of the power switch.

### 11.1 Power Supply Decoupling Capacitors

The TPA2080D1 requires adequate power supply decoupling to ensure a high efficiency operation with low total harmonic distortion (THD). Place a low equivalent-series-resistance (ESR) ceramic capacitor, typically $0.1 \mu \mathrm{~F}$, within 2 mm of the VBAT/PVDD pin. This choice of capacitor and placement helps with higher frequency transients, spikes, or digital hash on the line. In addition to the $0.1-\mu \mathrm{F}$ ceramic capacitor, TI recommends placing a $2.2-\mu \mathrm{F}$ to $10-\mu \mathrm{F}$ capacitor on the VBAT supply trace. This larger capacitor acts as a charge reservoir, providing energy faster than the board supply, thus helping to prevent any droop in the supply voltage.

## 12 Layout

### 12.1 Layout Guidelines

### 12.1.1 Component Placement

Place all the external components close to the TPA2080D1 device. Placing the decoupling capacitors as close as possible to the device is important for the efficiency of the class-D amplifier. Any resistance or inductance in the trace between the device and the capacitor can cause a loss in efficiency.

### 12.1.2 Thermal Considerations

It is important to operate the TPA2080D1 at temperatures lower than its maximum operating temperature. The maximum ambient temperature depends on the heat-sinking ability of the PCB system. Given $\theta_{\mathrm{JA}}$ of $97.3^{\circ} \mathrm{C} / \mathrm{W}$, the maximum allowable junction temperature of $150^{\circ} \mathrm{C}$, and the internal dissipation of 0.5 W for $1.9-\mathrm{W}, 8 \Omega$-load, $3.6-\mathrm{V}$ supply, the maximum ambient temperature is calculated as:

$$
\begin{equation*}
\mathrm{T}_{\mathrm{A}, \text { MAX }}=\mathrm{T}_{\mathrm{J}, \text { MAX }}-\theta_{\mathrm{JA}} \mathrm{P}_{\mathrm{D}}=150^{\circ} \mathrm{C}-\left(97.3^{\circ} \mathrm{C} / \mathrm{W} \times 0.5 \mathrm{~W}\right)=101.4^{\circ} \mathrm{C} \tag{5}
\end{equation*}
$$

The calculated maximum ambient temperature is $101.4^{\circ} \mathrm{C}$ at maximum power dissipation at $3.6-\mathrm{V}$ supply and $8-\Omega$ load. The TPA2080D1 is designed with thermal protection that turns the device off when the junction temperature surpasses $150^{\circ} \mathrm{C}$ to prevent damage to the IC.

### 12.1.3 Pad Size

TPA2080D1 has AGND, BGND and PGND for analog circuit, boost converter and Class-D amplifier respectively. These three ground pins should be connected together through a solid ground plane with multiple ground VIAs.
In making the pad size for the WCSP balls, it is recommended that the layout use non-solder mask defined (NSMD) land. With this method, the solder mask opening is made larger than the desired land area, and the opening size is defined by the copper pad width. Figure 25 shows the appropriate diameters for a WCSP layout.

## Layout Guidelines (continued)

Figure 25. Land Pattern Dimensions
Table 7. Land Pattern Dimensions ${ }^{(1) ~(2) ~(3) ~(4) ~}$

| SOLDER PAD <br> DEFINITIONS | COPPER <br> PAD | SOLDER MASK (5) <br> OPENING | COPPER <br> THICKNESS | STENCIL (6) (7) <br> OPENING | STENCIL <br> THICKNESS |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Nonsolder mask <br> defined (NSMD) | $275 \mu \mathrm{~m}$ <br> $(+0.0,-25 \mu \mathrm{~m})$ | $375 \mu \mathrm{~m}(+0.0,-25 \mu \mathrm{~m})$ | $1 \mathrm{oz} \mathrm{max} \mathrm{(32} \mathrm{\mu m)}$ | $275 \mu \mathrm{~m} \times 275 \mu \mathrm{~m} \mathrm{Sq}$ <br> (rounded corners) | $125 \mu \mathrm{~m}$ thick |

(1) Circuit traces from NSMD defined PWB lands should be $75 \mu \mathrm{~m}$ to $100 \mu \mathrm{~m}$ wide in the exposed area inside the solder mask opening. Wider trace widths reduce device stand off and impact reliability.
(2) Best reliability results are achieved when the PWB laminate glass transition temperature is above the operating the range of the intended application.
(3) Recommend solder paste is Type 3 or Type 4.
(4) For a PWB using a Ni/Au surface finish, the gold thickness should be less 0.5 mm to avoid a reduction in thermal fatigue performance.
(5) Solder mask thickness should be less than $20 \mu \mathrm{~m}$ on top of the copper circuit pattern
(6) Best solder stencil performance is achieved using laser cut stencils with electro polishing. Use of chemically etched stencils results in inferior solder paste volume control.
(7) Trace routing away from WCSP device should be balanced in $X$ and $Y$ directions to avoid unintentional component movement due to solder wetting forces.

### 13.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

### 13.1.2 Device Nomenclature

### 13.1.2.1 Boost Terms

The following is a list of terms and definitions used in the boost equations found in this document.

| C | Minimum boost capacitance required for a given ripple voltage on PVDD. |
| :--- | :--- |
| $L$ | Boost inductor |
| $f_{\text {BOOST }}$ | Switching frequency of the boost converter. |
| $I_{\text {PVDD }}$ | Current pulled by the Class-D amplifier from the boost converter. |
| $I_{L}$ | Average current through the boost inductor. |
| PVDD | Supply voltage for the Class-D amplifier. (Voltage generated by the boost converter output) |
| VBAT | Supply voltage to the IC. |
| $\Delta I_{L}$ | Ripple current through the inductor. |
| $\Delta V$ | Ripple voltage on PVDD. |

SLYZ022 - TI Glossary.
This glossary lists and explains terms, acronyms, and definitions.

## 14 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

### 14.1 Package Dimensions

The TPA2080D1 uses a 12-ball, 0.5 -mm pitch WCSP package. The die length (D) and width (E) correspond to the package mechanical drawing at the end of the datasheet.

Table 8. TPA2080D1 YZG Package Dimensions

| DIMENSION | D | E |
| :---: | :---: | :---: |
| Max | $2012 \mu \mathrm{~m}$ | $1560 \mu \mathrm{~m}$ |
| Typ | $1982 \mu \mathrm{~m}$ | $1530 \mu \mathrm{~m}$ |
| Min | $1952 \mu \mathrm{~m}$ | $1500 \mu \mathrm{~m}$ |

## PACKAGING INFORMATION

| Orderable Device | Status <br> (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan <br> (2) | Lead finish/ Ball material (6) | MSL Peak Temp <br> (3) | Op Temp ( ${ }^{\circ} \mathrm{C}$ ) | Device Marking <br> (4/5) | Samples |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| TPA2080D1YZGR | ACTIVE | DSBGA | YZG | 12 | 3000 | RoHS \& Green | SNAGCU | Level-1-260C-UNLIM | -40 to 85 | TPA2080D1 | Samples |
| TPA2080D1YZGT | ACTIVE | DSBGA | YZG | 12 | 250 | RoHS \& Green | SNAGCU | Level-1-260C-UNLIM | -40 to 85 | TPA2080D1 | Samples |

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device
${ }^{(2)}$ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as " Pb -Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the $<=1000 \mathrm{ppm}$ threshold requirement.
${ }^{(3)}$ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
${ }^{(4)}$ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
${ }^{(5)}$ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a " $\sim$ " will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
${ }^{(6)}$ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
