TUSB2E11
SLLSFI4A – NOVEMBER 2021 – REVISED JUNE 2022

TUSB2E11 USB 2.0-eUSB2 Repeater

1 Features

- USB 2.0 and eUSB2 (rev 1.2) compliant
- Low-speed, full-speed, high-speed signaling
- Best-in-class high-speed total jitter of 20 ps
- Register access protocol receptor capable
- Host and device mode (dual-role device) support
- Auto detection for I^2C or strap-pin options
  - Three strap-pins for USB 2.0 high-speed channel compensation settings
  - I^2C device interface for more configurations
- Device variants
  - eUSB2 1.0-V or 1.2-V signaling interface
  - eUSB2 trace loss compensation levels for different product form-factors
  - 1.2-V or 1.8-V I^2C interface
- Optional battery charging and detection support
  - BC 1.2 CDP or DCP divider mode advertising
  - Data-aware USB Type-C™ compatible BC 1.2 SDP, CDP, and DCP divider mode detection
  - Dual-role auto switching between charger advertising or detection
- CTA-936 USB Carkit UART support
- Supports auto-resume ECR as well as L2 interrupt resume mode
- Optional GPIOs: interrupt GPIO2, debug, I^2C ↔ GPIO0/1
- I^2C accessible debug capabilities for manufacturing tests

2 Applications

- Notebooks and desktops
- Cell phones
- Tablets
- Wearables
- Portable electronics

3 Description

TUSB2E11 is a USB compliant eUSB2 to USB 2.0 repeater supporting both device and host modes.

The device supports USB low-speed (LS), full-speed (FS) signals, and high-speed (HS) signals.

The device has multiple patented designs to provide robust interoperability, optimum performance, and power.

For systems without an I^2C interface, the device offers eight individual settings with three strap-pins for USB 2.0 channel Equivalent Series Resistance (ESR) up to 20 Ω. Device variants are available for different levels of eUSB2 trace length compensation up to 10 inches.
The I^2C interface permits additional flexibility for fine tuning of device RX equalization and TX amplitude, slew rate and pre-emphasis to pass electrical compliance tests and compensate for channel loss.

Various debug options are available through the 3 GPIO pins that can be configured to monitor various USB bus states or interrupt as well as CTA-936 UART mode that can provide SoC debug capabilities. GPIO0 and GPIO1 can be used as general purpose I^2C to GPIOs bridge.

Device Information[1]

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TUSB2E11	DSBGA (15)	1.30 mm × 2.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Auto-resume ECR	not supported	supported (enabled by default) [see register 0x78h]
L2 State Interrupt Resume	supported	supported

5.1 Device Variants

For more information and availability of device variants such as eUSB2 1.0 signaling interface, 1.2 V I^{2}C interface, and 1.2 V GPIO interface please contact support.

6 Pin Configuration and Functions

Figure 6-1. TUSB2E11 YCG Package, 15-Pin DSBGA (Top View)

Table 6-1. Pin Functions

PIN		TYPE[2]	REST STATE	ASSOCIATED ESD SUPPLY	DESCRIPTION
NAME	NO.				
VDD3V3	B2	PWR	N/A	N/A	3.3 V Supply Voltage
VDD1V8	D2, E3	PWR	N/A	N/A	1.8 V Supply Voltage
VSS	A3, D3	GND	N/A	N/A	GND
RESETB	D1	I	N/A	VDD1V8	• Active Low Reset • Upon de-assertion of RESETB, repeater will be enabled and be in eUSB2 default mode awaiting configuration from eDSPr or eUSPr. • If RESETB is not actively controlled, a pull-up resistor 100 kΩ to VDD1V8 is required.

Product Folder Links: *TUSB2E11*

Table 6-1. Pin Functions (continued)

PIN		TYPE[2]	REST STATE	ASSOCIATED ESD SUPPLY	DESCRIPTION				
NAME	NO.								
SCL	C3	I	Internal pulldown 1 MΩ typical (disabled after reset)[1]	VDD1V8	I^2C Clock	Device Mode Matrix	**SCL**	**SDA**	**Mode**
							Low	See Table 6-4 for more details	Non-I^2C USB Repeater
SDA	B3	I/O	Hi-Z[1]	VDD1V8	Bidirectional I^2C data Open drain I/O		High	Low	Non-I^2C UART mode Repeater
							High	High	I^2C Enabled
GPIO2	C2	I/O	Internal pulldown 1 MΩ typical (disabled after reset)	VDD1V8	• In I^2C mode GPIO2 will be an open drain active low level interrupt output. Connect GPIO2 to input of APU and a pull-up resistor to use interrupt features • In non I^2C mode GPIO2 defaults to USB configuration input at power up reset. • When a pull-up resistor is used to set high input, ensure VIH is met accounting for internal pull down as small as 500 kΩ • GPIO2 is an open-drain output after reset and can be left floating when not used.				
GPIO0	B1	I/O	Internal pulldown 1 MΩ typical (disabled after reset)[1]	VDD1V8	Defaults to an input mode at power up reset. RESETB assertion and de-assertion or soft reset will revert GPIO0 to input mode • In I^2C mode GPIO0 will default to control Carkit UART mode: active low to enable Carkit UART mode. Default Carkit UART direction is DP → eDP (RX) and eDN → DN (TX). GPIO0 must be pulled up to be in USB repeater mode. • In non I^2C mode GPIO0 defaults to USB configuration input at power up reset. • When a pull-up resistor is used to set high input, ensure VIH is met accounting for internal pull down as small as 500 kΩ				
GPIO1	C1	I/O	Internal pulldown 1 MΩ typical (disabled after reset)[1]	VDD1V8	Defaults to an input mode at power up reset. RESETB assertion and de-assertion or soft reset will revert GPIO1 to input mode • In I^2C mode GPIO1 defaults to debug input • In non I^2C mode GPIO1 defaults to USB Configuration input at power up reset. • When a pull-up resistor is used to set high input, ensure VIH is met accounting for internal pull down as small as 500 kΩ				
eDN	A2	I/O	Hi-Z	VDD1V8	eUSB2 port D-				
eDP	A1	I/O	Hi-Z	VDD1V8	eUSB2 port D+				
DN	E2	I/O	Hi-Z	VDD3V3	USB port D-				
DP	E1	I/O	Hi-Z	VDD3V3	USB port D+				

(1)   When configured as an input but not actively driven, use 1 MΩ external pull-down to strap low.
(2)   I = input, I/O = input or output, PWR= power, GND = ground

Table 6-2. Pin Configuration for Device Mode

Device Mode	SCL (C3)	SDA (B3)	GPIO0 (B1)	GPIO1 (C1)	GPIO2 (C2)
I^{2}C Mode	Pull-up Input sampled at reset	Pull-up Input sampled at reset	Default to Input • Low = UART Mode • High = USB repeater mode Function can be reconfigured through register	Default to Input Function can be reconfigured through register	Default to Open drain output (can be left floating when not used) Function can be reconfigured through register
Non I^{2}C UART mode	Pull-up Input sampled at reset	Pull-down Input sampled at reset	Default to Input • Low = UART transfer enabled • High = UART transfer disabled	High-Z (can be left floating)	High-Z (can be left floating)
Non I^{2}C USB repeater mode	Pull-down Input sampled at reset See Table 6-4	See Table 6-4	Default input sampled at reset. See Table 6-3

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)[1]

		MIN	MAX	UNIT
Supply voltage range	V_{DD3V3}	−0.3	4.32	V
Analog Supply voltage range	V_{DD1V8}	−0.3	2.1	V
Voltage range	DP, DN, (with OVP enabled), 1000 total number of short events and cummulative duration of 1000 hrs.	−0.3	6	V
Voltage range	eDP, eDN	−0.3	1.6	V
Voltage range	RESETB, GPIO0, GPIO1, GPIO2, SCL, SDA	−0.3	2.1	V
Junction temperature	$T_{J(max)}$		125	°C
Storage temperature	T_{stg}	−65	150	°C

(1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. Absolute maximum ratings do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If briefly operating outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not sustain damage, but it may not be fully functional. Operating the device in this manner may affect device reliability, functionality, performance, and shorten the device lifetime.

7.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins[1]	±1500	V
		Charged device model (CDM), per JEDEC specification JS-002, all pins[2]	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{DD3V3}	Supply voltage (VDD3V3)	3.0	3.3	3.6	V
V_{DD1V8}	Analog Supply voltage (VDD1V8)	1.62	1.8	1.98	V
$V_{\_I2C\_Pullup}$	I2C and GPIO open drain Bus Voltage (1.2 V Variant)	1.08	1.2	1.32	V
$V_{\_I2C\_Pullup}$	I2C and GPIO open drain Bus Voltage (1.8 V Variant)	1.62	1.8	1.98	V
USB Voltage	DP, DN	0		3.6	V
eUSB2 voltage	eDP, eDN	0		1.32	V
Digital voltage	RESETB, GPIO0, GPIO1, GPIO2, SCL, SDA (1.8 V Variant)	0		1.98	V
Digital voltage	RESETB, GPIO0, GPIO1, GPIO2, SCL, SDA (1.2 V Variant)	0		1.32	V
T_A	Operating free-air temperature	−20		85	°C
T_J	Junction temperature	−20		105	°C
T_{CASE}	Case temperature	−20		105	°C
T_{PCB}	PCB temperature (1 mm away from the device)	−20		92	°C

7.4 Thermal Information

THERMAL METRIC[1]		TUSB2E11	UNIT
		YCG (DSBGA)	
		15 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	90.5	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	0.6	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	22.9	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	0.4	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	22.9	°C/W

(1) For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report.

7.5 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER						
P_{WC_1V8}	Absolute worst case peak power consumption (VDD1V8 only) for power supply budgeting	I2C interface active, GPIOs in output mode, repeater in HS mode with USB transmitting, maximum RX EQ, max TX VOD and PE settings, maximum transition density. T_A = −20°C to 85°C.			280	mW
P_{WC_3V3}	Absolute worst case peak power consumption (VDD3V3 only) for power supply budgeting	I2C interface active, GPIOs in output mode, repeater in HS mode with USB transmitting, maximum RX EQ, max TX VOD and PE settings, maximum transition density. T_A = –20°C to 85°C.			30	mW
P_{WCFS_3V3}	Absolute worst case peak power consumption (VDD3V3 only) for power supply budgeting	I2C interface active, GPIOs in output mode, repeater in FS mode with USB Asynchronous traffic. T_A = –20°C to 85°C.			75	mW
P_{HS_IOC}	USB Audio ISOC High-speed	Maximum TX Vod/Maximum TX PE for both USB and eUSB2. Averaged over 8 ms and only 1 uFrame with data packet. Toff threshold = 1/32. Host Peripheral Mode.		35		mW
P_{PD}	Powered down	Device powered, RESETB=Low, T_A=25°C, (DP/DN Voltage ≤ VDD3V3).			9	µW
$P_{Disabled}$	Disabled	Device powered, I2C/GPIO interfaces functional but idle, repeater is disabled and put into the lowest power state and non-functional. T_A=25°C, (DP/DN Voltage ≤ VDD3V3).		43	95	µW
P_{Detach}	USB unconnected	I2C/GPIO interfaces idle, repeater is connected to a eUSB2 PHY and waiting for a USB attach event. T_A = 25°C, (DP/DN Voltage ≤ VDD3V3)		43	85	µW
$P_{Suspend}$	L2 Suspend (host mode)	I2C/GPIO interfaces idle, USB link is in L2, repeater is monitoring for a resume/remote wake event. T_A = 25°C, (DP/DN Voltage ≤ VDD3V3). In peripheral mode additional current is present due the DP pull up.		45	85	µW

Product Folder Links: *TUSB2E11*

7.5 Electrical Characteristics (continued)

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
P_{Sleep}	L1 Sleep	I2C/GPIO interfaces idle, repeater is supporting a USB connection, USB link is in L1 (host exists L1 every 1 ms) and repeater is monitoring for a L1 exit event. T_A = 25°C, (DP/DN Voltage ≤ VDD3V3)		2.3	5	mW
P_{LS_Active}	Low Speed Active	I2C/GPIO interfaces idle, repeater in LS mode, maximum transition density. T_A = 85°C.		7.2	24	mW
P_{FS1_Active}	Full Speed Active (ASYNC Traffic)	I2C/GPIO interfaces idle, repeater in FS mode, maximum transition density. T_A = 85°C.		45	80	mW
P_{FS2_Active}	Full Speed Active (ISO Traffic)	I2C/GPIO interfaces idle, repeater in FS mode, maximum transition density. T_A = 85°C.		9	24	mW
$P_{HS\_Idle\_Host}$	High Speed Idle (Host mode)	L0.Idle. TA = 85°C. (Typical at 25°C).		26	70	mW
$P_{HS\_Idle\_Peripheral}$	High Speed Idle (Peripheral mode)	L0.Idle. TA = 85°C. (Typical at 25°C).		108	200	mW
DIGITAL INPUTS						
V_{IH}	High level input voltage	GPIO0, GPIO1, GPIO2 (1.2 V Variant)	0.702			V
V_{IH}	High level input voltage	GPIO0, GPIO1, GPIO2 (1.8 V Variant)	1.053			V
V_{IL}	Low-level input voltage	GPIO0, GPIO1, GPIO2 (1.2 V Variant			0.462	V
V_{IL}	Low-level input voltage	GPIO0, GPIO1, GPIO2 (1.8 V Variant)			0.693	V
V_{IL}	Low-level input voltage	RESETB			0.35	V
V_{IH}	High level input voltage	RESETB	0.75			V
I_{IH}	High level input current	V_{IH} = 1.98 V, VDD3V3=3.0 V or 0 V, VDD1V8=1.62 V or 0 V RESETB, GPIO0, GPIO1			0.5	µA
I_{IL}	Low level input current	V_{IL} = 0 V, VDD3V3=3.0 V or 0 V, VDD1V8=1.62 V or 0 V RESETB, GPIO0, GPIO1			0.5	µA
DIGITAL OUTPUTS						
V_{OH}	High level output voltage	GPIO0, GPIO1, GPIO2, push-pull I/O mode (I_{OH} = 20 µA and maximum 3 pF $C_{load})$ (1.2 V Variant)	0.81			V
V_{OH}	High level output voltage	GPIO0, GPIO1, GPIO2, push-pull I/O mode (I_{OH} = 20 µA and maximum 3 pF C_{load})(1.8 V Variant)	1.21			V
V_{OL}	Low level output voltage	GPIO0, GPIO1, GPIO2, push-pull I/O mode (I_{OL} = 1 mA) (1.2 V Variant)			0.25	V
V_{OL}	Low level output voltage	GPIO0, GPIO1, GPIO2, push-pull I/O mode (I_{OL} = 1 mA) (1.8 V Variant)			0.35	V
I_{OL_PP}	Low level output current in push-pull mode	GPIO0, GPIO1, GPIO2 (1.2 V Variant), VOL=0.4 V	2.5	4	5.6	mA
I_{OL_PP}	Low level output current in push-pull mode	GPIO0, GPIO1, GPIO2 (1.8 V Variant), VOL=0.4 V	4	6	8	mA
I_{OH_PP}	High level output current in push-pull mode	GPIO0, GPIO1, GPIO2, push-pull I/O mode, VOH=0.9 V (1.2 V Variant)	22			µA
I_{OH_PP}	High level output current in push-pull mode	GPIO0, GPIO1, GPIO2, push-pull I/O mode, VOH=0.9 V (1.8 V Variant)	50			µA
I2C (SDA, SCL)						
V_{IL}	Low level input voltage, 1.2 V variant	SDA, SCL, V_{I2C_Pullup} = 1.08 V			0.387	V

7.7 Timing Requirements

|		MIN	NOM	MAX	UNIT
I/O TIMING					
t_{GPIO_PW}	Minimum GPIO pulse width for interrupt event	8			µs
RESET TIMING					
t_{VDD1V8_RAMP}	Ramp time for VDD1V8 to reach minimum 1.62 V			2	ms
t_{VDD3V3_RAMP}	Ramp time for VDD3V3 to reach minimum 3.0 V			2	ms
$t_{aRESETB}$	Duration for RESETB to be asserted low to complete reset while powered	10			us
t_{RH_READY}	Time for the device to be ready to accept RAP and I^{2}C requests and eUSB2 interface to be ready after RESETB is de-asserted or (VDD1V8 and VDD3V3) reach the minimum recommended voltages, whichever is later.			3	ms
t_{RS_READY}	Time for the device to be ready to accept RAP and I2C requests and eUSB2 interface to be ready after a soft reset through I^{2}C.			350	µs
REPEATER TIMING					
T_{J1E}	Total additive jitter for eUSB2 to USB 2.0 (output jitter − input jitter) of the repeater.		20	42	ps
T_{J1I}	Total additive jitter for USB 2.0 to eUSB2 (output jitter − input jitter) of the repeater.		17	42	ps
$T_{e\_to\_U\_DJ1}$	eUSB2 to USB 2.0 repeater FS jitter to next transition (Per *Low-Speed / Full-Speed DC Specifications for 1.2 V ± 10%* [1] condition for supply and GND delta).	−6.0		+6.0	ns
$T_{U\_to\_e\_DJ1}$	USB 2.0 to eUSB2 repeater FS jitter to next transition (Per *Low-Speed / Full-Speed DC Specifications for 1.2 V ± 10%* [1] condition for supply and GND delta).	−3.0		+3.0	ns
T_{DJ2_e2U}	repeater FS paired transition jitter in eUSB2 to USB 2.0 direction (relaxed relative to THDJ2 defined by USB 2.0 ± 1 ns). eUSB2 in 1.2 V signaling mode.	−1.5		+1.5	ns
T_{DJ2_U2e}	repeater FS paired transition jitter in USB 2.0 to eUSB2 direction (relaxed relative to THDJ2 defined by USB 2.0 ± 1 ns). eUSB2 in 1.2 V signaling mode.	−1.5		+1.5	ns
MODE TIMING					
T_{MODE_SWITCH}	Time needed to change mode from UART bypass mode to and from USB mode			1	µs
T_{UART_START}	Time needed to start transmitting UART data, post toggling GPIO0 to '0' when in UART strap mode (SCL=1, SDA=0 at power-up)			2	ms
I2C (FM+)					
t_{SU_STA}	Start setup time, SCL (T_f=72 ns – 120 ns), SDA (T_f=6.5 ns – 81.5 ns), 1 MHz FM+	260			ns
t_{SU_STO}	Stop setup time, SCL (T_f=72 ns –120 ns), SDA (T_f=6.5 ns – 81.5 ns), 1 MHz FM+	260			ns
t_{HD_STA}	Start hold time, SCL (T_f=72 ns – 120 ns), SDA (T_f=6.5 ns – 81.5 ns), 1 MHz FM+	260			ns
t_{SU_DAT}	Data input or false start/stop, setup time, SCL (T_f=72 ns – 120 ns), SDA (T_f=6.5 ns – 81.5 ns), 1 MHz FM+	50			ns
t_{HD_DAT}	Data input or False start/stop, hold time, SCL (T_f=72 ns – 120 ns), SDA (T_f=6.5 ns – 81.5 ns), 1 MHz FM+	0			ns
t_{VD_DAT}, t_{VD_ACK}	SDA output delay, SCL (T_f=72 ns – 120 ns), SDA (T_f=6.5 ns – 81.5 ns), 1 MHz FM+	20		450	ns
$t_{HD\_DAT\_SL}$	Data hold time when device is transmitting	6.67			ns
t_{SP}	Glitch width suppressed	50		91	ns
t_{BUF}	Bus free time between a STOP and START condition (Master minimum spec that device must tolerate)	0.5			µs

Product Folder Links: *TUSB2E11*

		MIN	NOM	MAX	UNIT
t_{LOW}	Low period for SCL clock (minimum spec that device must tolerate)	0.5			µs
t_{HIGH}	HIgh period for SCL clock (minimum spec that device must tolerate)	0.26			µs
I2C (FM)					
t_{SU_STO}	Stop setup time, SCL (T_r=180 ns – 300 ns), SDA (T_f=6.5 ns – 106.5 ns), 400 kHz FM	600			ns
t_{HD_STA}	Start hold time, SCL (Tr=180 ns – 300 ns), SDA (Tf=6.5 ns – 106.5 ns), 400 kHz FM	600			ns
t_{SU_STA}	Start setup time, SCL (T_r=180 ns – 300 ns), SDA (T_f=6.5 ns – 106.5 ns), 400 kHz FM	600			ns
t_{SU_DAT}	Data input or false start/stop, setup time, SCL (T_r=180 ns – 300 ns), SDA (T_f=6.5 ns – 106.5 ns), 400 kHz FM	100			ns
t_{HD_DAT}	Data input or false start/stop, hold time, SCL (T_r=180 ns – 300 ns), SDA (T_f=6.5 ns – 106.5 ns), 400 kHz FM	0			ns
t_{VD_DAT}, t_{VD_ACK}	SDA output delay, SCL (T_r=180 ns – 300 ns), SDA (T_f=6.5 ns – 106.5 ns), 400 kHz FM	20		900	ns
$t_{HD\_DAT\_SL}$	Data hold time when device is transmitting	13.5			ns
t_{SP}	Glitch width suppressed	50		91	ns
t_{BUF}	Bus free time between a STOP and START condition (minimum spec that device must tolerate)	1.3			µs
t_{LOW}	Low period for SCL clock (minimum spec that device must tolerate)	1.3			µs
t_{HIGH}	HIgh period for SCL clock (Master minimum spec that device must tolerate)	0.6			µs
I2C (STD)					
t_{SU_STO}	Stop setup time, SCL (T_f=600 ns – 1000 ns), SDA (T_f=6.5 ns – 106.5 ns), 100 kHz STD	4			µs
t_{HD_STA}	Start hold time, SCL (Tr=600 ns – 1000 ns), SDA (Tf=6.5 ns – 106.5 ns), 100 kHz STD	4			µs
t_{SU_STA}	Start setup time, SCL (T_r=600 ns – 1000 ns), SDA (T_f=6.5 ns – 106.5 ns), 100 kHz STD	4.7			µs
t_{SU_DAT}	Data input or false start/stop, setup time, SCL (T_r=600 ns – 1000 ns), SDA (T_f=6.5 ns – 106.5 ns), 100 kHz STD	250			ns
t_{HD_DAT}	Data input or false start/stop, hold time, SCL (T_r=600 ns – 1000 ns), SDA (T_f=6.5 ns – 106.5 ns), 100 kHz STD	5			µs
t_{VD_DAT}, t_{VD_ACK}	SDA output delay, SCL (T_f=600 ns – 1000 ns), SDA (T_f=6.5 ns – 106.5 ns), 100 kHz STD			3.45	µs
$t_{HD\_DAT\_SL}$	Data hold time when device is transmitting	13.5			ns
t_{SP}	Glitch width suppressed	50		91	ns
t_{BUF}	Bus free time between a STOP and START condition (minimum spec that device must tolerate)	4.7			µs
t_{LOW}	Low period for SCL clock (minimum spec that device must tolerate)	4.7			µs
t_{HIGH}	HIgh period for SCL clock (minimum spec that device must tolerate)	4.0			µs

Figure 7-3. eUSB2 TX Output (Ingress) Jitter, Eye Mask Test Setup

8 Detailed Description

8.1 Overview

The TUSB2E11 is an eUSB2 to USB 2.0 repeater that resides between the SoC with an eUSB2 port and an external connector that supports USB 2.0. It can be configured by the register access protocol (RAP) or through the I^{2}C. The repeater is configurable as either a host or device repeater (DRD repeater).

I^{2}C port supports up to 1 MHz (fast mode plus) for internal register access. A subset of internal registers can be accessed through the register access protocol. Simultaneous register access using RAP and through the I^{2}C is supported with RAP having priority over I^{2}C.

To power up in I^{2}C mode, both SDA and SCL should have pull-up resistors to appropriate I^{2}C bus voltage.

GPIO2 output pin can be configured to provide an active low open drain or selectable active low or active high push-pull level sensitive interrupt output to the SoC.

8.2 Functional Block Diagram
Figure 8-1. Functional Block Diagram

Product Folder Links: *TUSB2E11*

8.3 Feature Description

TUSB2E11 is an USB compliant eUSB2 to USB 2.0 repeater supporting both device and host modes. Both USB and eUSB2 offer fully tunable TX and RX through I2C. Additionally, USB TX and RX can be tuned when I2C is not used.

8.4 Device Functional Modes

8.4.1 Repeater Mode

Upon de-assertion of RESETB or software reset and after t_{RH_READY} or t_{RS_READY}, TUSB2E11 will enable and enter the default state and be ready to accept eUSB2 packets, RAP, and I2C requests. The repeater will either be in host repeater mode or peripheral repeater mode depending on the receipt of either host mode enable or peripheral mode enable.

When TUSB2E11 is repeating high-speed packets, either from eUSB2 to USB 2.0 or from USB 2.0 to eUSB2, up to 4UI (may include partial UI) of HS SOP could be truncated. This is the same as a standard USB 2.0 HUB operating in high speed mode which could truncate up to 4UI.

When TUSB2E11 is repeating high-speed packets from eUSB2 to USB 2.0, up to 1.6UI of random dribble bits (may include partial UI) could be introduced after HS EOP. This is the less than a standard USB 2.0 HUB operating in high speed mode which could have up to 4UI of random dribble bits.

When TUSB2E11 is repeating high-speed packets from USB 2.0 to eUSB2, up to 5UI of random dribble bits (may include partial UI) could be introduced after HS EOP. This is more than a standard USB 2.0 HUB operating in high speed mode which could have up to 4UI of random dribble bits. eDSPr/eUSPr receiving eUSB2 high-speed packets should ignore 5UI of dribble bits after detecting no stuffed bit insertion indicating HS EOP.

Table 8-1. Number of Hubs Supported with Host and Peripheral Repeater

Number of eUSB2 Repeaters	Number of Hubs Operating at HS	Number of Hubs Operating at FS	
1	4	2	Number of hubs operating at FS is reduced due to $T_{e\_to\_U\_DJ1}$ and T_{RJR1}.
2	3	1	Number of hubs operating at HS is reduced due to 2 3 1 SOP truncation and EOP dribble
0	5	5	non-eUSB2 system for reference

8.4.2 Power Down Mode

RESETB could be used as a power down pin when asserted low. Power down mode will put TUSB2E11 in lowest power mode.

8.4.3 Disabled Mode

The repeater could be disabled by setting DISABLE bit through the I2C.

8.4.4 UART Mode

In I^{2}C mode GPIO0 will default to being an enable control for Carkit UART mode. GPIO0 is an active low signal to enable Carkit UART mode. GPIO0 is intended to be controlled through APU or SoC. When APU or SoC is not powered on or the firmware has not been loaded, the GPIO0 will be low, enabling the UART mode to allow APU or SoC debug interface to be accessed through the USB port.

Default Carkit UART direction is DP → eDP (RX) and eDN → DN (TX).

On the rising edge of GPIO0, followed by T$_{MODE\_SWITCH}$, TUSB2E11 will enable and enter default state and be ready to accept eUSB2 port reset, configuration or RAP. The repeater mode will be configured as host or peripheral depending on the eUSB2-defined configuration received from eUSBr and acknowledged by the repeater.

UART mode enable is controlled through GPIO0 after power up. This can be changed through UART_use_bit1_P1 bit in UART-PORT1 register, so UART mode enable could be controlled through a register instead of GPIO0.

8.4.5 Auto-Resume ECR

Optional host repeater auto-resume is supported by TUSB2E11 in L1/L2 by driving Resume K at D+/D- until SOResume is received from eDSPr. In addition, TUSB2E11 eUSPh will hold Remote Wake line state until SORresume is received from eDSPr.

This auto-resume feature provides host controller extra time to exit low power state and issue SOResume while TUSB2E11 UDSP drives resume within 1 ms (TURSM) hub resume timing requirement. To take advantage of this low power feature, host controller shall implement low power mechanism to detect wake on eDSPr lines while host controller is in low power state.

This auto-resume is not needed if host controller is capable of initiating SOResume within 1 ms of detecting Remote Wake on eDSPr.

This auto-resume is enabled by default but can be disabled via bit 6 of register 0x78. This auto-resume ECR mode is disabled when L2 interrupt mode is enabled. When L2 interrupt mode is enabled, resume K at D+/D- is still driven when Remote wake is detected on UDSP but eUSPh will be held at SE0 instead of in Remote Wake state. See the *L2 State Interrupt Modes* section for more details.

Figure 8-2. Timing Diagram for Auto-Resume for HS/FS

8.4.6 L2 State Interrupt Modes

To prevent signaling on eUSB2 while the eDSP is powered off, both L2 remote wake interrupt and disconnect event interrupt modes should be enabled. The special remote wake sequence when L2 remote wake interrupt mode is enabled.
- System enables interrupt USB_REMOTE_WAKE_P1.
- Repeater is in host mode and has received a CM.L2.
- Repeater detects wake on USB 2.0
- Repeater asserts interrupt.
- Repeater reflects *resume* on USB 2.0, but does not signal wake on eUSB2.
- Repeater waits for eDSPr to signal start of resume with no intervening configuration, connect, or reset sequence.
- Repeater and eDSP follow normal eUSB2 protocol to signal resume starting and ending in L0.
Figure 8-3. Timing Diagram for Wake Interrupt for HS/FS

The special wake on disconnect sequence when disconnect event interrupt mode is enabled
- System enables interrupt USB_DISCONNECT_P1.
- Repeater is in host mode and has received a CM.L2.
- Repeater detects SE0 for disconnect on USB 2.0.
- Repeater asserts interrupt.
- Interrupt must be cleared prior to eDSPr reinitializing TUSB2E11 as a host.
- Repeater does not signal or report USB 2.0 SE0 on eUSB2.
- Repeater waits for eDSPr to power up, which starts with port reset announcement.
- Repeater and eDSP follow normal eUSB2 protocol, ending in unconnected state of host mode.
Figure 8-4. Timing Diagram for Disconnect Interrupt for HS/FS

8.4.7 Attach Detect Interrupt Mode

When attach event detect is enabled TUSB2E11 will issue an interrupt event instead of signaling attach on eUSB2.

- System enables interrupt USB_DETECT_ATTACH_P1. Interrupt has to be enabled prior to any connect event.
- Repeater is in host mode.
- Repeater detects attach on USB 2.0.
- Repeater debounces attach for 60 µs and asserts interrupt instead of signaling attach on eUSB2.
- Interrupt must be disbled prior to eDSPr reinitializing as a host to process attach through normal mechanism.

Figure 8-5. Timing Diagram for Attach Detect Interrupt for HS/FS

8.4.8 GPIO Mode

GPIO0

GPIO0 pin will be in input mode at power up, will be sampled during reset.

GPIO0 defaults to active low UART mode (bypass mode) enable control after power up. This can be changed through the UART_use_bit1_P1 bit in UART-PORT1 register, so GPIO0 can be repurposed. Refer to UART Mode.

GPIO0 pin can be configured to be input or output mode through the I^{2}C register write. Output event is selected through the I^{2}C register. Refer to *GPIO0_CONFIG register* for more information.

GPIO0 input status change can be reported through the GPIO2 as an interrupt if enabled through the I^{2}C. Status change trigger can be programmed to be edge trigger or level trigger through the I^{2}C.

GPIO0 pin in output mode will default to open drain output but can be configured to be push-pull output. GPIO0 pin can drive up to 3 pF loads when in push-pull mode.

GPIO0 pin will revert back to input upon RESETB assert, de-assert, or soft reset.

In non I^{2}C mode, GPIO0 is used for USB PHY tuning.

GPIO1

GPIO1 pin will be in input mode at power up, will be sampled during reset.

GPIO1 will be configured as an enable control for battery charger detection in repeater default state if DEFAULT_STATE_BC_P1 is set to 0x01 through the BC_CONTROL register.

GPIO1 pin can be configured to be input or output mode through the I^{2}C register write. Output event is selected through the I^{2}C register. Refer to GPIO1_CONFIG register.

GPIO1 input status change can be reported through the GPIO2 as an interrupt if enabled through the I^{2}C. Status change trigger can be programmed to be edge trigger or level trigger through the I^{2}C.

GPIO1 pin in output mode will default to open drain output but can be configured to be push-pull output. GPIO1 pin can drive up to 3 pF loads when in push-pull mode.

GPIO1 pin will revert back to input upon RESETB assert, de-assert, or soft reset.

In non I^{2}C mode, GPIO1 is used for USB PHY tuning.

GPIO2

GPIO2 pin will default to open drain interrupt (INT) active low output at power up but can be programmed through the I^{2}C to be a push-pull output. In push-pull mode, it can be programmed to be either active high or active low. Interrupt output will be level sensitive interrupt. Trigger events can be selected through the I^{2}C.

Connect GPIO2 to APU to use interrupt functions and a pull-up resistor (open drain mode).

GPIO2 interrupt output can be configured through the INT_ENABLE and INT_STATUS registers.

GPIO2 can be configured as battery charger detect indicator instead of the interrupt output through the BC_CONTROL register.

In non I^{2}C mode, GPIO2 is used for USB PHY tuning.

8.4.9 USB 2.0 High-Speed HOST Disconnect Detection

USB 2.0 specification does not specify high-speed output differential swing V_{OD} during disconnect without external load. Only chirp level and HS host disconnect threshold are specified. Specification implicitly assumes high-speed output differential swing V_{OD} will double during disconnect. However, the high-speed output differential swing during disconnect depends on the USB 2.0 TX output swing and pre-emphasis setting as the common mode voltage increase will saturate the output swing level and might not double.

HS host disconnect threshold shall be adjusted to provide the most margin to avoid false disconnect as well as failure to detect a disconnect. See Table 8-2.

Table 8-2. Recommended USB 2.0 High-speed HOST Disconnect Thresholds per USB HSTX Amplitude and Pre-Emphasis

USB HS TX Amplitude (Vp-p)	USB HS TX Pre-Emphasis					
	0.5 dB (0h)	0.9 dB (1h)	1.2 dB (2h)	1.7 dB (3h)	2.1 dB (4h)	2.5 dB (5h)
740 mV (0h)	545 mV (1h)	545 mV (1h)	545 mV (1h)	545 mV (1h)	545 mV (1h)	545 mV (1h)

1040 mV (Fh)	745 mV (Bh)	725 mV (Ah)	725 mV (Ah)	705 mV (9h)	705 mV (9h)	685 mV (8h)

8.5 Manufacturing Test Modes

Below test procedures show how to use I^{2}C to enter test modes to perform continuity test of DP/DM during manufacturing or debug. During this mode the TUSB2E11 will not operate as a repeater.

Product Folder Links: *TUSB2E11*

8.5.1 USB DP Test Procedure

I^2C Commands to use DP pull-up to test DP/DM continuity:

Enable GPIOs and DP Pull-up:

h00, hA0 <-set gpio0 to push-pull output mode

h40, hA0 <-set gpio1 to push-pull output mode

hD5, h28

hD6, h04

hD7, h10 <-DP pull-up is now on

hCE, h18

hDC, h15 <-muxes DP / DM status onto GPIO lines

Status Readback Check:

h00 = hA0 <-DM status on bit 4 (normal, DM low)

h40 = hB0 <-DP status on bit 4 (normal, DP high)

h00 = hB0 <-DM status on bit 4 (DP + DM shorted together)

h40 = hA0 <-DP status on bit 4 (DP shorted to ground)

Exit Test Mode:

hB2, h80 <-soft reset (end test)

8.5.2 USB DM Test Procedure

I^2C Commands to use DM pull-up to test DP/DM continuity:

Enable GPIOs and DM Pull-up:

h00, hA0 <-set gpio0 to push-pull output mode

h40, hA0 <-set gpio1 to push-pull output mode

hD5, h28

hD6, h04

hD7, h08 <-DM pull-up is now on

hCE, h18

hDC, h15 <-mux DP / DM status onto GPIO lines

Status Readback Check:

h00 = hB0 <-DM status on bit 4 (normal, DM high)

h40 = hA0 <-DP status on bit 4 (normal, DP low)

h40 = hB0 <-DP status on bit 4 (DP + DM shorted together)

h00 = hA0 <-DM status on bit 4 (DM shorted to ground)

Exit Test Mode:

hB2, h80 <-soft reset (end test)

8.6 I^{2}C Target Interface

I^{2}C target interface enables access to internal registers by the system application processor. The primary function of the interface is to enable configuring various PHY parameters, controlling the GPIO pins, and enabling USB-BC functions. TUSB2E11 repeater functions will operate upon power up without requiring I^{2}C configuration.

TUSB2E11 has I^{2}C 7-bit target address of 0x3E. 8-bit address of Write: 0x7C and Read: 0x7D.

I^{2}C default target address could be changed at the factory through one time programming.

I^{2}C drive strength could be changed through the I^{2}C.

Table 8-3. Recommended I^{2}C Drive Strength for I^{2}C Bus Speed, Bus Pull Up and Bus Capacitance

I^{2}C FM+ (1 MHz Max)	I^{2}C drive strength (I$_{OL}$) selection			
	I2C bus pull up R$_{PU}$			
C(bus) pF	1 kΩ	2.2 kΩ	4 kΩ	7 kΩ
10-50	≅8 mA	≅4 mA	N/A	N/A
10-90	≅8 mA	N/A	N/A	N/A
10-150	N/A	N/A	N/A	N/A
10-200	N/A	N/A	N/A	N/A

I^{2}C FM (400kHz Max)	I^{2}C drive strength (I$_{OL}$) selection			
	I^{2}C bus pull up R$_{PU}$			
C(bus) pF	1 kΩ	2.2 kΩ	4 kΩ	7 kΩ
10-50	≅8 mA	≅4 mA	≅2 mA	N/A
10-90	≅8 mA	≅4 mA	N/A	N/A
10-150	≅8 mA	≅8 mA	N/A	N/A
10-200	≅8 mA	N/A	N/A	N/A

| I^{2}C STD (100 kHz Max)	I^{2}C drive strength (I$_{OL}$) selection			
	I^{2}C bus pull up R$_{PU}$			
C(bus) pF	1 kΩ	2.2 kΩ	4 kΩ	7 kΩ
10-50	≅8 mA	≅4 mA	≅2 mA	≅1 mA
10-90	≅8 mA	≅4 mA	≅2 mA	≅1 mA
10-150	≅8 mA	≅4 mA	≅2 mA	≅2 mA
10-200	≅8 mA	≅4 mA	≅2 mA	≅2 mA

Figure 8-6. I^{2}C Write with Data

The following procedure should be followed to write data to TUSB2E11 I^{2}C registers (refer to Figure 8-6):

1. The host initiates a write operation by generating a start condition (S), followed by the TUSB2E11 7-bit address and a zero-value "W/R" bit to indicate a write cycle.
2. The TUSB2E11 acknowledges the address cycle.
3. The host presents the register offset within TUSB2E11 to be written, consisting of one byte of data, MSB-first.
4. The TUSB2E11 acknowledges the sub-address cycle.
5. The host presents the first byte of data to be written to the I^{2}C register.
6. The TUSB2E11 acknowledges the byte transfer.

Product Folder Links: *TUSB2E11*

7. The host may continue presenting additional bytes of data to be written, with each byte transfer completing with an acknowledge from the TUSB2E11.
8. The host terminates the write operation by generating a stop condition (P).

Figure 8-7. I²C Read Without Repeated Start

The following procedure should be followed to read the TUSB2E11 I²C registers without a repeated Start (refer Figure 8-7).

1. The host initiates a read operation by generating a start condition (S), followed by the TUSB2E11 7-bit address and a zero-value "W/R" bit to indicate a read cycle.
2. The TUSB2E11 acknowledges the 7-bit address cycle.
3. Following the acknowledge the host continues sending clock.
4. The TUSB2E11 transmit the contents of the memory registers MSB-first starting at register 00h or last read register offset+1. If a write to the I²C register occurred prior to the read, then the TUSB2E11 shall start at the register offset specified in the write.
5. The TUSB2E11 waits for either an acknowledge (ACK) or a not-acknowledge (NACK) from the host after each byte transfer; the I²C host acknowledges reception of each data byte transfer.
6. If an ACK is received, the TUSB2E11 transmits the next byte of data as long as host provides the clock. If a NAK is received, the TUSB2E11 stops providing data and waits for a stop condition (P).
7. The host terminates the write operation by generating a stop condition (P).

Figure 8-8. I²C Read with Repeated Start

The following procedure should be followed to read the TUSB2E11 I²C registers with a repeated Start (refer Figure 8-8).

1. The host initiates a read operation by generating a start condition (S), followed by the TUSB2E11 7-bit address and a zero-value "W/R" bit to indicate a write cycle.
2. The TUSB2E11 acknowledges the 7-bit address cycle.
3. The host presents the register offset within TUSB2E11 to be written, consisting of one byte of data, MSB-first.
4. The TUSB2E11 acknowledges the register offset cycle.
5. The host presents a repeated start condition (Sr).
6. The host initiates a read operation by generating a start condition (S), followed by the TUSB2E11 7-bit address and a one-value "W/R" bit to indicate a read cycle.
7. The TUSB2E11 acknowledges the 7-bit address cycle.
8. The TUSB2E11 transmit the contents of the memory registers MSB-first starting at the register offset.
9. The TUSB2E11 shall wait for either an acknowledge (ACK) or a not-acknowledge (NACK) from the host after each byte transfer; the I²C host acknowledges reception of each data byte transfer.

10. If an ACK is received, the TUSB2E11 transmits the next byte of data as long as host provides the clock. If a NAK is received, the TUSB2E11 stops providing data and waits for a stop condition (P).
11. The host terminates the read operation by generating a stop condition (P).

Figure 8-9. I^{2}C Write Without Data

The following procedure should be followed for setting a starting sub-address for I^{2}C reads (refer to Figure 8-9).

1. The host initiates a write operation by generating a start condition (S), followed by the TUSB2E11 7-bit address and a zero-value "W/R" bit to indicate a write cycle.
2. The TUSB2E11 acknowledges the address cycle.
3. The host presents the register offset within TUSB2E11 to be written, consisting of one byte of data, MSB-first.
4. The TUSB2E11 acknowledges the register offset cycle.
5. The host terminates the write operation by generating a stop condition (P).

Note

After initial power-up, if no register offset is included for the read procedure (refer to Figure 8-7), then reads start at register offset 00h and continue byte by byte through the registers until the I^{2}C host terminates the read operation. During a read operation, the TUSB2E11 auto-increments the I^{2}C internal register address of the last byte transferred independent of whether or not an ACK was received from the I^{2}C host.

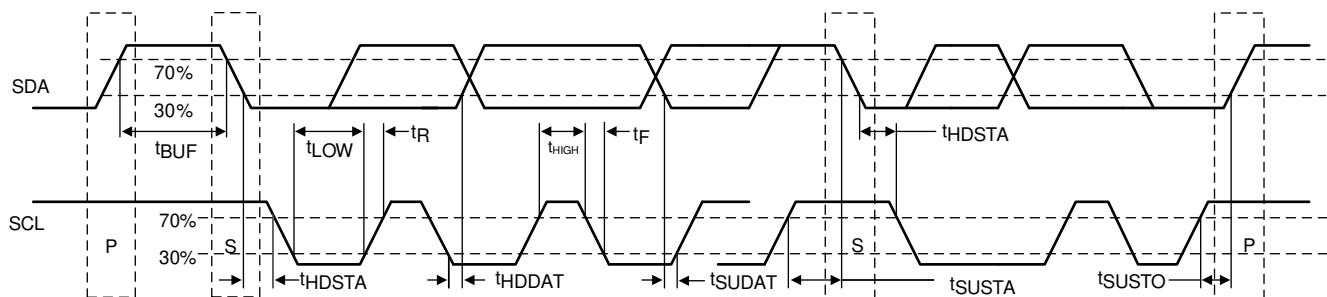

Figure 8-10. I^{2}C Timing Diagram

9 Register Access Protocol (RAP)

The repeater in TUSB2E11 supports the register access protocol (RAP) over eUSB2 to allow access to its related registers.

RAP accessible registers are indicated with corresponding RAP addresses in the register map. Default value of a subset of the registers are factory programmable and are indicated in register map.

10 Register Map

10.1 TUSB2E11 Registers

Table 10-1 lists the TUSB2E11 registers. All register offset addresses not listed in Table 10-1 should be considered as reserved locations and the register contents should not be modified.

Table 10-1. TUSB2E11 Registers

Offset	Acronym	Register Name	Section
70h	U_TX_ADJUST_PORT1	RAP Register for Port 1 (0h), Default through OTP	Go
71h	U_HS_TX_PRE_EMPHASIS_P1	RAP Register for Port 1 (1h), Default through OTP	Go
72h	U_RX_ADJUST_PORT1	RAP Register for Port 1 (2h), Default through OTP	Go
73h	U_DISCONNECT_SQUELCH_PORT1	RAP Register for Port 1 (3h), Default through OTP	Go
77h	E_HS_TX_PRE_EMPHASIS_P1	RAP Register for Port 1 (7h), Default through OTP	Go
78h	E_TX_ADJUST_PORT1	RAP Register for Port 1 (8h), Default through OTP	Go
79h	E_RX_ADJUST_PORT1	RAP Register for Port 1 (9h), Default through OTP	Go
0h	GPIO0_CONFIG		Go
40h	GPIO1_CONFIG		Go
50h	UART_PORT1	RAP Register for Port 1 (20h)	Go
B0h	REV_ID		Go
B2h	GLOBAL_CONFIG		Go
B3h	INT_ENABLE_1		Go
B4h	INT_ENABLE_2		Go
B6h	BC_CONTROL		Go
B7h	BC_STATUS_1		Go
A3h	INT_STATUS_1		Go
A4h	INT_STATUS_2		Go
60h	CONFIG_PORT1		Go
F5h	TEST_MODE1		Go

Complex bit access types are encoded to fit into small table cells. Table 10-2 shows the codes that are used for access types in this section.

Table 10-2. TUSB2E11 Access Type Codes

Access Type	Code	Description
Read Type		
H	H	Set or cleared by hardware
R	R	Read
RH	R H	Read Set or cleared by hardware
Write Type		
W	W	Write
W1C	W 1C	Write 1 to clear
WtoP	W	Write
Reset or Default Value		
- *n*		Value after reset or the default value

10.1.1 GPIO0_CONFIG Register (Offset = 00h) [Reset = 00h]

GPIO0_CONFIG is shown in GPIO0_CONFIG Register Field Descriptions.

Return to the Summary Table.

Table 10-3. GPIO0_CONFIG Register Field Descriptions

Bit	Field	Type	Reset	Description
7	GPIO0_OD_PP	R/W	0h	GPIO0 output type 0h = open drain output 1h = push pull ouput
6	Reserved	R	0h	Reserved
5	GPIO0_DIRECTION	R/W	0h	GPIO0 direction 0h = input 1h = output
4	GPIO0_INPUT_STATUS	RH	0h	Logical value of GPIO0 pin input (0=Low, 1=High) 0h = input is low 1h = input is high
3-0	GPIO0_OUTPUT_SELECT	R/W	0h	Dh = HIGH_OUTPUT – output is forced static high Eh = LOW_OUTPUT – output is forced static low

10.1.2 GPIO1_CONFIG Register (Offset = 40h) [Reset = 00h]

GPIO1_CONFIG is shown in GPIO1_CONFIG Register Field Descriptions.

Return to the Summary Table.

Table 10-4. GPIO1_CONFIG Register Field Descriptions

Bit	Field	Type	Reset	Description
7	GPIO1_OD_PP	R/W	0h	GPIO1 output type selection 0h = open drain output 1h = push pull ouput
6	GPIO1_IN_TRIGGER_TYPE	R/W	0h	GPIO1 input trigger type selection for interrupt 0h = edge trigger input 1h = level trigger input (GPIO2 output will reflect the input level state)
5	GPIO1_DIRECTION	R/W	0h	GPIO1 direction selection 0h = input 1h = output
4	GPIO1_INPUT_STATUS	RH	0h	Logical value of GPIO1 pin input status (0=Low, 1=High) 0h = input is low 1h = input is high

Product Folder Links: *TUSB2E11*

Table 10-4. GPIO1_CONFIG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3-0	GPIO1_OUTPUT_SELECT	R/W	0h	GPIO1 output selection 0h = Remote wakeup – host repeater is receiving remote wake but has not seen start of resume 1h = USB disconnect – host repeater is actively forwarding LS/FS disconnect. 2h = USB_HS_Unsqulched – host repeater in L0 seeing USB HS or in reset seeing Chirp 3h = PVTB – HOST repeater is actively transmitting ESE1 due to HS disconnect. 4h = DEFAULT – waiting to be configured host/peripheral 5h = HOST – in host repeater mode 6h = PERIPHERAL – in peripheral repeater mode 7h = CONNECTED – repeater is connected, connection seen acknowledged by start of reset 8h = RESET – reset in progress, reset is detected is high, L0 is low 9h = L0 – fully configured and repeating data, keep-alive and reset/disconnect Ah = L1 – device has received CM.FS/CM.L1,has stopped repeating and is waiting for wake or resume Bh = L2 – device has received CM.L2, has stopped repeating and is waiting for wake or resume. Ch = GPIO1_HS_TEST – in host repeater in L0 mode, received CM.TEST Dh = HIGH_OUTPUT – output is forced static high Eh = LOW_OUTPUT – output is forced static low Fh = OVP – over voltage (DP/DN voltage > VOVP_TH) detected on the USB DP/DN

10.1.3 U_TX_ADJUST_PORT1 Register (Offset = 70h) [Reset = 7Ch]

U_TX_ADJUST_PORT1 is shown in Table 10-5.

Return to the Summary Table.

Hardware default value can be overridden through factory programmable OTP for this register.

Table 10-5. U_TX_ADJUST_PORT1 Register Field Descriptions

Bit	Field	Type	Reset	Description
7-6	U_HS_TERM_P1	RH/W	1h	0h = 42.75 Ω (typical) 1h = 45 Ω (typical) (default) 2h = 47.25 Ω (typical) 3h = 49.5 Ω (typical)

0	CDP_2_STATUS_P1	RH	0h	Primary detection detected on port1 if CDP_2_EN_P1=1 0h = CDP primary detection detected 1h = CDP primary detection not detected

10.1.20 TEST_MODE1 Register (Offset = F5h) [Reset = 32h]

TEST_MODE1 is shown in TEST_MODE1 Register Field Descriptions.

Return to the Summary Table.

Table 10-22. TEST_MODE1 Register Field Descriptions

Bit	Field	Type	Reset	Description
7-4	Reserved	R/W	0h	Reserved, make sure to rewrite what was read
3	FORCE_HS_L0	R/W	0h	Force repeater into high-speed L0 state for test purposes only. 0h = normal repeater mode (setting this bit to 0 will not return the device to normal repeater mode, the device needs to be hard reset, soft reset or power cycled) 1h = forced high-speed L0 mode
2-0	Reserved	R/W	2h	Reserved, make sure to rewrite what was read

11 Application and Implementation

> **Note**
>
> Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

11.1 Application Information

TUSB2E11 can be used in either HOST or Peripheral implementation. The mode is configured by the eUSB2 SoC.

11.2 Typical Application
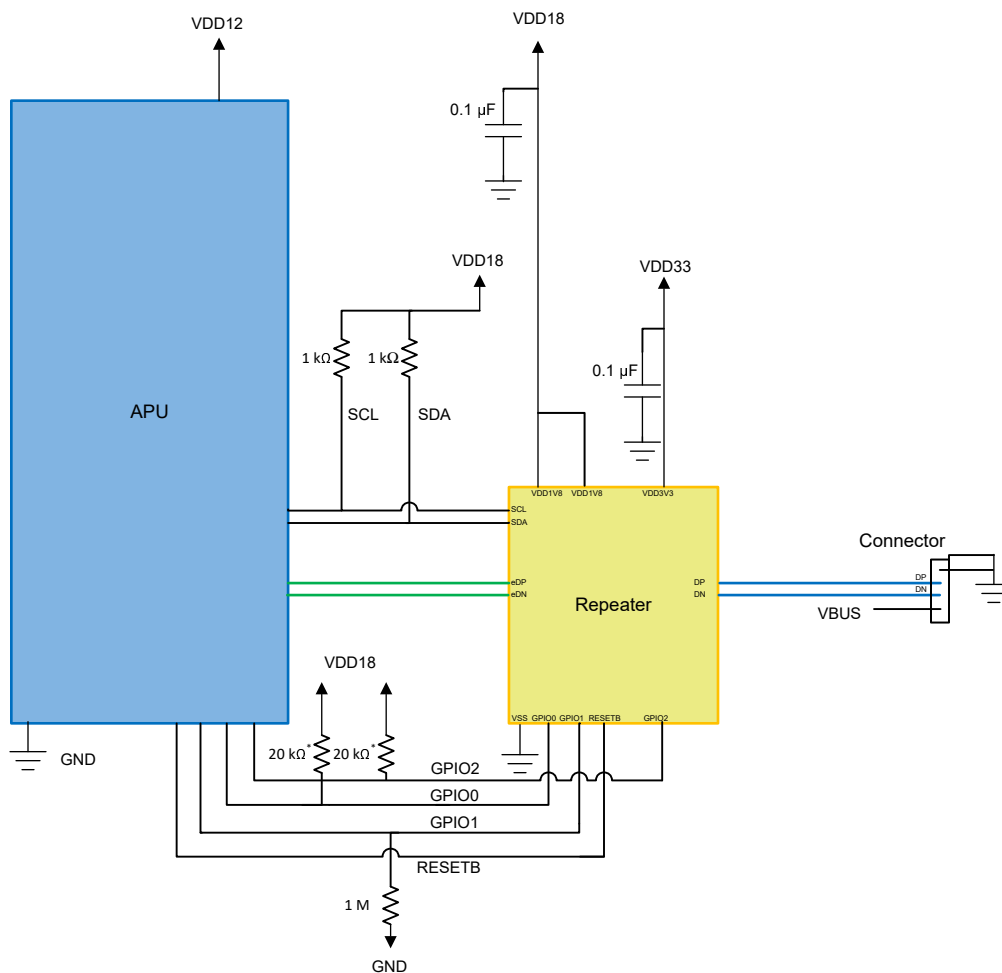

Figure 11-1. Typical System Implementation Using 1.8 V I^{2}C Variant

The 0.1 µF recommendation per supply pin is based on capacitor placement of 2 mm or less trace length away. If the placement of capacitor is further away, the value of the capacitor needs to be redetermined to account for the additional trace inductance and maintain resonance around 12 MHz. Additionally, system power design should have adequate bulk capacitance to account for maximum transient current expected by the device when transitioning from low power mode to active mode. GPIO2 can be optionally used as interrupt output. Note that the pull-up resistor on GPIO[0:2] should be adjusted based on leakage of the APU I/O to ensure VIH and VIL of GPIO0 are met.

Product Folder Links: *TUSB2E11*
Figure 11-2. Typical System Implementation Using 1.8 V Variant without I²C (Configured for Charger Detection)

The 0.1 µF recommendation per supply pin is based on capacitor placement of 2 mm or less trace length away. If the placement of the capacitor is further away, then the value of the capacitor needs to be redetermined to account for the additional trace inductance and maintain resonance around 12 MHz. Additionally, system power design should have adequate bulk capacitance to account for maximum transient current expected by the device when transitioning from low power mode to active mode. GPIO2 can be optionally used as interrupt output. Note that the pull-up and pull-down resistors on GPIO[0:2] should be selected based on USB PHY tuning needs. SDA should be used for Vbus_valid detection with a voltage divider. GPIO1 and GPIO2 can be routed as needed for charger detection status. Pull-down resistor value on SCL determines the battery charging mode.

11.2.1 Design Requirements

TUSB2E11 requires a valid reset signal as described in the *Power Supply Recommendations* section.

For design examples, use the parameters shown in Table 11-1, Table 11-2, and Table 11-3.

Table 11-1. Design Parameters for High Loss USB 2.0 System Using I²C

PARAMETER			VALUE[1]
V_{DD3V3}			3.3 V ±10%
V_{DD1V8}			1.8 V ±5%
I²C support required in system (Yes or No)			Yes
Parameter	**Register**	**Setting**	**Value**
USB 2.0 TX Swing (peak to peak)	U_TX_ADJUST_PORT1 (Offset = 70h)	7Ch	980 mVp-p

Product Folder Links: *TUSB2E11*

Table 11-1. Design Parameters for High Loss USB 2.0 System Using I²C (continued)

PARAMETER			VALUE[1]
USB 2.0 TX Pre-emphasis	U_HS_TX_PRE_EMPHASIS_P1 (Offset = 71h)	3Ch	2.1 dB
USB 2.0 RX Equalization	U_RX_ADJUST_PORT1 (Offset = 72h)	92h	1.09 dB
USB 2.0 HS host disconnect threshold (peak differential)	U_DISCONNECT_SQUELCH_PORT1 (Offset = 73h)	83h	685 mV
USB 2.0 HS squelch/RX sensitivity threshold (peak differential)	U_DISCONNECT_SQUELCH_PORT1 (Offset = 73h)	83h	111 mV

Table 11-2. Design Parameters for Medium Loss USB 2.0 System Using I²C

PARAMETER			VALUE[1]
V_{DD3V3}			3.3 V ±10%
V_{DD1V8}			1.8 V ±5%
I²C support required in system (Yes or No)			Yes
Parameter	**Register**	**Setting**	**Value**
USB 2.0 TX Swing (peak to peak)	U_TX_ADJUST_PORT1 (Offset = 70h)	79h	920 mVp-p
USB 2.0 TX Pre-emphasis	U_HS_TX_PRE_EMPHASIS_P1 (Offset = 71h)	39h	0.9 dB
USB 2.0 RX Equalization	U_RX_ADJUST_PORT1 (Offset = 72h)	92h	1.09 dB
USB 2.0 HS host disconnect threshold (peak differential)	U_DISCONNECT_SQUELCH_PORT1 (Offset = 73h)	83h	685 mV
USB 2.0 HS squelch/RX sensitivity threshold (peak differential)	U_DISCONNECT_SQUELCH_PORT1 (Offset = 73h)	83h	111 mV

(1)   These parameters are starting values for a high loss system. Further tuning might be required based on specific loss profile and measurements.

Table 11-3. Design Parameters for Medium Loss USB 2.0 System without I²C and Configured for Charger Detection

PARAMETER				VALUE[1]
V_{DD3V3}				3.3 V ±10%
V_{DD1V8}				1.8 V ±5%
I²C support required in system (Yes or No)				No
SCL (pull-down resistor to ground)				1.65 kΩ
SDA (pull-down resistor to ground)				100 kΩ
SDA (pull-up resistor to VBUS5V)				324 kΩ
Parameter	**GPIO0**	**GPIO1**	**GPIO2**	**Value**
USB 2.0 TX Swing (peak to peak)	Float	Pull-up	Pull-up	920 mVp-p
USB 2.0 TX Pre-emphasis	Float	Pull-up	Pull-up	0.9 dB
USB 2.0 RX Equalization	Float	Pull-up	Pull-up	1.09 dB
USB 2.0 HS host disconnect threshold (peak differential)	Float	Pull-up	Pull-up	685 mV
USB 2.0 HS squelch/RX sensitivity threshold (peak differential)	Float	Pull-up	Pull-up	98 mV

(1)   These parameters are starting values for a medium loss system. Further tuning might be required based on specific loss profile and measurements.

11.2.2 Detailed Design Procedure

The ideal PHY setting is dependent upon the signal chain loss characteristics of the target platform. The recommendation is to start with lowest level of compensation for TX swing and pre-emphasis, and then increment until optimal eye diagram margin is achieved. Same applies to the RX sensitivity or squelch threshold setting where it is recommended to adjust from low threshold until optimum RX sensitivity and squelch margins are achieved.
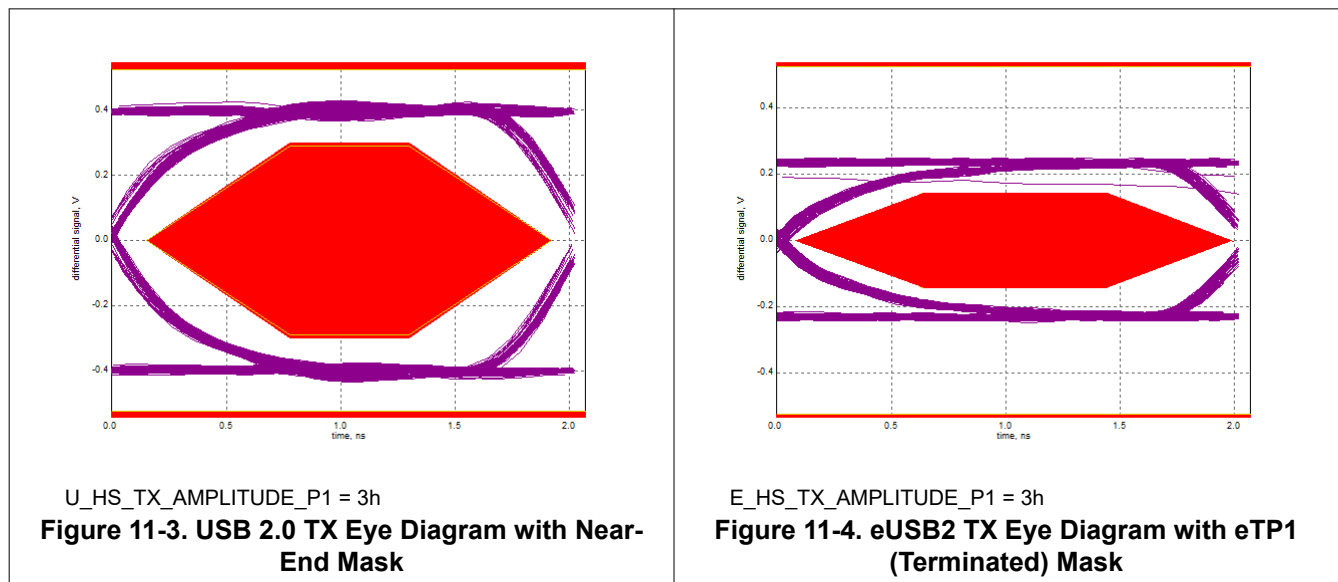

To optimize the TUSB2E11 RX equalization, monitor the corresponding TX eye digram to achieve best RX EQ setting. In other words, to optimize eUSB2 RX equlization, monitor USB 2.0 TX eye and monitor eUSB2.0 TX eye to optimize USB RX equalization.

HS host disconnect threshold shall be adjusted to provide the most margin to avoid false disconnect as well as failure to detect a disconnect. See Table 8-2.

Note

The TUSB2E11 compensates for extra attenuation in the signal path according to the configuration of the TX and RX settings. General recommendation is to use just enough pre-emphasis and equalization to achieve eye margin and not over-equalize to avoid excessive jitter. Maximum PE width and slew rates are recommended.

11.2.3 Application Curves

U_HS_TX_AMPLITUDE_P1 = 3h
Figure 11-3. USB 2.0 TX Eye Diagram with Near-End Mask

E_HS_TX_AMPLITUDE_P1 = 3h
Figure 11-4. eUSB2 TX Eye Diagram with eTP1 (Terminated) Mask

12 Power Supply Recommendations

12.1 Power Up Reset

RESETB pin is active low reset pin and can also be used as a power down pin.

TUSB2E11 does not have power supply sequence requirements between VDD3V3 and VDD1V8.

Maximum VDD3V3 and VDD1V8 ramp time to reach minimum supply voltages should be 2 ms.

Digital and analog inputs may be applied when VDD3V3 and VDD1V8 are in unpowered state.

Internal power on reset circuit along with the external RESETB input pin ensures proper initialization when RESETB is de-asserted high prior to the power rails being valid. If RESETB de-assert high before the power supplies are stable, internal power on reset circuit will hold off internal reset until the supplies are stable.

I^2C/RAP and eUSB2 interfaces will be ready after t_{RH_READY} upon de-assertion of RESETB or power up.

I^2C/RAP and eUSB2 interfaces will be ready after t_{RH_READY} upon soft reset through the I^2C.

Upon de-assertion of RESETB (after t_{RH_READY}) or software reset (after t_{RH_READY}), TUSB2E11 will enable and enter default state and be ready to accept eUSB2 packets, RAP and I^2C requests. The repeater will either be in host repeater mode or device repeater mode depending on the receipt of either host mode enable or peripheral mode enable.

13 Layout

13.1 Layout Guidelines

1. Place supply bypass capacitors as close to VDD1V8 and VDD3V3 pins as possible and avoid placing the bypass caps near the eDP/eDN and DP/DN traces.
2. Route the high-speed USB signals using a minimum of vias and corners which reduces signal reflections and impedance changes. When a via must be used, increase the clearance size around it to minimize its capacitance. Each via introduces discontinuities in the signal's transmission line and increases the chance of picking up interference from the other layers of the board. Be careful when designing test points on twisted pair lines; through-hole pins are not recommended.
3. When it becomes necessary to turn 90°, use two 45° turns or an arc instead of making a single 90° turn. This reduces reflections on the signal traces by minimizing impedance discontinuities.
4. Do not route USB traces under or near crystals, oscillators, clock signal generators, switching regulators, mounting holes, magnetic devices or ICs that use or duplicate clock signals.
5. Avoid stubs on the high-speed USB signals due to signal reflections. If a stub is unavoidable, then the stub must be less than 200 mil.
6. Route all high-speed USB signal traces over continuous GND planes, with no interruptions.
7. Avoid crossing over anti-etch, commonly found with plane splits.
8. Due to high frequencies associated with the USB, a printed circuit board with at least four layers is recommended; two signal layers separated by a ground and power layer as shown in Figure 13-1.

Figure 13-1. Four-Layer Board Stack-Up

13.2 Example Layout for Application with 1.8 V I²C Variant

Figure 13-2 shows how GPIO2 can be optionally used as an open drain interrupt output with a pull-up resistor to VDD18.

Figure 13-2. Example Layout for Application with 1.8 V I²C Variant

14.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

14.7 Glossary

TI Glossary   This glossary lists and explains terms, acronyms, and definitions.

15 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGE OPTION ADDENDUM

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TUSB2E111YCGR	ACTIVE	DSBGA	YCG	15	3000	RoHS & Green	SNAGCU	Level-1-260C-UNLIM	-20 to 85	T2E111A	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
